## Acknowledgements

### Funding

In 2024, the Ecstasy and Related Drugs Reporting System (EDRS), falling within the Drug Trends program of work, was supported by funding from the Australian Government Department of Health and Aged Care under the Drug and Alcohol Program.

### Research Team

The National Drug and Alcohol Research Centre (NDARC), University of New South Wales (UNSW) Sydney, coordinated the EDRS. The following researchers and research institutions contributed to EDRS 2024:

- Dr Rachel Sutherland, Antonia Karlsson, Julia Uporova, Olivia Price, Udesha Chandrasena, Haniene Tayeb, Professor Louisa Degenhardt, Professor Michael Farrell and Associate Professor Amy Peacock, National Drug and Alcohol Research Centre, University of New South Wales, New South Wales;
- Zachary Lloyd and Professor Paul Dietze, Burnet, Victoria;
- Sophie Radke and Associate Professor Raimondo Bruno, School of Psychology, University of Tasmania, Tasmania;
- Dr Jodie Grigg, Dr Sophie Haywood and Professor Simon Lenton, National Drug Research Institute and enAble Institute, Curtin University, Western Australia; and
- Catherine Daly, Dr Jennifer Juckel, Dr Natalie Thomas and Associate Professor Caroline Salom, Institute for Social Science Research, The University of Queensland, Queensland.

We would like to thank past and present members of the research team.

### Participants

We would like to thank all the participants who were interviewed for the EDRS in the present and in previous years.

### Contributors

We thank all the individuals who contributed to questionnaire development and assisted with the collection and input of data at a jurisdictional and national level. We would like to thank the Students for Sensible Drug Policy (SSDP) and the Drug Trends Advisory Committee for their contribution to the EDRS.

We acknowledge the traditional custodians of the land on which the work for this report was undertaken. We pay respect to Elders past, present, and emerging.

## Executive Summary

The EDRS comprises a sentinel sample of people who regularly use ecstasy and/or other illicit stimulants, recruited via social media and word-of-mouth across each capital city of Australia. The results are not representative of all people who use illicit drugs, nor of use in the general population. **Data were collected in 2024 from April-July. Interviews from 2020 onwards were delivered face-to-face as well as via telephone and videoconference, to reduce risk of COVID-19 transmission; all interviews prior to 2020 were conducted face-to-face. This methodological change should be factored into all comparisons of data from the 2020-2024 samples relative to previous years.**

### Sample Characteristics

In 2024, the national EDRS sample (n=740) differed in some ways to the sample in 2023. Whilst median age (23 years) and gender identity (55% male) remained stable, a significant change was observed in participants' employment status ( $p=0.011$ ), current median weekly income (\$700; \$808 in 2023;  $p=0.002$ ), and current accommodation ( $p=0.007$ ). Drug of choice significantly changed ( $p<0.001$ ), with more participants nominating cannabis (25%; 20% in 2023) and ecstasy (27%; 24% in 2023) as their drugs of choice in 2024. The drugs used most often in the month preceding interview also significantly changed in 2024 ( $p<0.001$ ), with more participants reporting cannabis (33%; 29% in 2023) and fewer reporting alcohol (13%; 22% in 2023) as the drugs used most often.

### Non-Prescribed Ecstasy

Recent use of any non-prescribed ecstasy remained stable in 2024 (92%; 95% in 2023), as did frequency of use (8 days; 7 days in 2023). Capsules remained the most commonly used

form of non-prescribed ecstasy in 2024 (59%), followed by crystal (48%), pills (43%) and powder (30%). The median price for one gram of non-prescribed ecstasy crystal significantly decreased (\$220; \$250 in 2023;  $p=0.007$ ), while the median price for one pill and capsule remained stable (\$30 and \$25, respectively). Perceived purity significantly changed for non-prescribed ecstasy capsules ( $p=0.010$ ), whereby more participants perceived purity to be 'high' (36%; 29% in 2023). Significant changes were also observed in the perceived availability of all four forms of non-prescribed ecstasy. Specifically, more participants nominated availability as 'easy' or 'very easy' in 2024, with estimates similar to those observed previously in 2020 and earlier.

### Methamphetamine

Recent methamphetamine use among this sample has been declining over time, with one quarter (25%) reporting recent use in 2024, a significant decrease from 30% in 2023 ( $p=0.037$ ). Whilst crystal remained the most commonly used form of methamphetamine, a significant decrease in recent use was observed (16%; 22% in 2023;  $p=0.010$ ). Conversely, frequency of crystal significantly increased in 2024 to a median of 42 days (20 days in 2023;  $p=0.008$ ). Recent use and frequency of use remained stable for methamphetamine powder and base. The price, perceived purity and perceived availability remained stable for both methamphetamine powder and crystal between 2023 and 2024, with the largest per cent of participants nominating 'high' purity, and most reporting 'easy' or 'very easy' obtainment.

### Non-Prescribed Pharmaceutical Stimulants

Past six month use of non-prescribed pharmaceutical stimulants steadily increased between 2007 (17%) and 2022 (52%), before declining in 2023 (47%) and then increasing again in 2024 (54%;  $p=0.010$ ). Whilst most participants reported swallowing as a route of administration in 2024 (94%), significantly more participants reported snorting (26%; 20% in 2023;  $p=0.045$ ). The price of a 5mg tablet significantly decreased in 2024, from \$6 in 2023 to \$5 ( $p=0.029$ ), although perceived availability remained stable.

### Cocaine

Past six month cocaine use remained stable but high in 2024 (80%; 81% in 2023). The vast majority of participants who had recently consumed cocaine reported using powder cocaine (95%). Price and perceived availability of cocaine remained stable between 2023 and 2024, however perceived purity significantly changed ( $p=0.012$ ), with more participants reporting cocaine to be of 'high' purity (26%; 21% in 2023), and fewer reporting it to be of 'low' purity (26%; 36% in 2023).

### Cannabis and/or Cannabinoid-Related Products

Recent use of non-prescribed cannabis and/or cannabinoid-related products remained stable in 2024 (75%) relative to 2023 (74%), as did frequency of use (median of 48 days in 2024). Hydroponic cannabis was the most used form of non-prescribed cannabis in 2024 (69%; 63% in 2023;  $p=0.037$ ), followed by bush cannabis (53%; 51% in 2023). The price, perceived purity and perceived availability of hydroponic and bush cannabis remained stable in 2024 relative to 2023. As in previous years, most perceived availability of hydroponic and bush cannabis to be 'easy' or 'very easy' to obtain.

### Non-Prescribed Ketamine, LSD and DMT

Recent use of non-prescribed ketamine (53%; 49% in 2023), LSD (36%; 41% in 2023) and DMT (10%; 13% in 2023) remained stable in 2024. Median frequency of use remained low for all three substances, ranging between two and four days in the six months preceding interview. The median price for an LSD tab remained stable at \$25, while the median price for a gram of non-prescribed ketamine significantly decreased (\$200; \$250 in 2023;  $p=0.040$ ). Perceived purity and availability for both non-prescribed ketamine and LSD remained stable between 2023 and 2024.

### New Psychoactive Substances (NPS)

Recent use of any NPS (including plant-based NPS) significantly increased in 2024, from 12% in 2023 to 16% ( $p=0.022$ ). Phenethylamines remained the most commonly used NPS class in 2024 (6%); this mostly comprised use of any 2C substance (5%). In 2024, there were significant increases in participants reporting use of 2-Fluorodeschloroketamine (2-FDCK) (1%; 0% in 2023;  $p=0.038$ ) and 'other drugs that mimic the effects of ecstasy' (2%; 0% in 2023;  $p<0.001$ ).

### Other Drugs

Recent use of kava (7%; 4% in 2023;  $p=0.011$ ), and any substance with 'unknown contents' (20%; 13% in 2023;  $p<0.001$ ) significantly increased in 2024. Recent use of tobacco also significantly increased in 2024 (72%; 64% in 2023;  $p<0.001$ ), as did median frequency of use (90 days; 50 days in 2023;  $p=0.028$ ).

## Drug-Related Harms and Other Behaviours

### *Polysubstance use and bingeing*

On the last occasion of ecstasy or related drug use, 82% of participants reported concurrent use of two or more drugs (excluding tobacco and e-cigarettes).

Nearly one third (30%) of participants reported using stimulants or related drugs for 48 hours or more continuously without sleep in the six months preceding interview.

### *Dependence, overdose and injecting*

Three quarters (76%) of participants obtained an AUDIT score of  $\geq 8$ , indicative of hazardous alcohol use. Sixteen per cent of those who reported recent ecstasy use obtained an SDS score of  $\geq 3$ , while 41% of participants reporting recent methamphetamine use obtained a score of  $\geq 4$ , indicating possible dependence on these substances.

Past year non-fatal stimulant overdose remained stable in 2024 (19%), however, past year non-fatal depressant overdose increased (28%; 22% in 2023;  $p=0.014$ ).

Past month injecting drug use was low (1%).

### *Drug checking and naloxone awareness*

One quarter (27%) of participants reported that they or someone else had tested the content and/or purity of their illicit drugs in Australia in the past year, a significant decrease from 38% in 2023 ( $p<0.001$ ).

In 2024, 63% of the sample reported that they had ever heard of naloxone, a significant increase from 57% in 2023 ( $p=0.015$ ).

### *Sexual activity, mental health and health service access*

Almost four fifths (78%) of the sample reported engaging in sexual activity in the past four

weeks, of which 81% reported using alcohol and/or other drugs prior to or while engaging in sexual activity.

Almost three fifths (58%) of the sample self-reported that they had experienced a mental health problem in the preceding six months. Twenty-two per cent reported a score of  $\geq 30$  on the K10, indicating very high psychological distress.

Almost one third (30%) of participants reported accessing any health service for alcohol and/or drug support in the past six months preceding interview. Current drug treatment engagement remained low (6%).

One quarter (28%) of the sample reported experiencing stigma because of their illicit drug use in any health/non-health care setting in the six months preceding interview.

### *Driving, contact with police and modes of purchasing drugs*

Among recent drivers, 29% reported driving while over the perceived legal limit of alcohol, and 50% reported driving within three hours of consuming an illicit or non-prescribed drug in the past six months, a significant increase relative to 2023 (44%;  $p=0.037$ ).

Seven per cent of participants reported past year arrest, while 14% reported a drug-related encounter with police which did not result in charge or arrest (e.g., stopped and searched/questioned).

In 2024, the most popular means of arranging the purchase of illicit or non-prescribed drugs in the 12 months preceding interview was face-to-face (74%), followed by social networking or messaging applications (70%). Most participants continued to report obtaining illicit drugs from a friend/relative/partner/colleague (84%), although this increased relative to 2023 (79%;  $p=0.032$ ).

# 2024 SAMPLE CHARACTERISTICS

# EDRS

Ecstasy and Related Drugs Reporting System

In 2024, 740 participants, recruited from all capital cities across Australia, were interviewed.

**23 years** **Male**

The median age in 2024 was 23, and 55% identified as male.

Current students **39%**  
Full time work **30%**  
Unemployed **23%**

In the 2024 sample, 39% were current students, 30% were employed full time and 23% were unemployed.

**Ecstasy**

**Cocaine**

**Other stimulants**

Participants were recruited on the basis that they had consumed ecstasy and/or other illicit stimulants at least monthly in the past 6 months.

## DRUG-RELATED HARMS AND RISKS

Drug driving **50%**  
Drink driving **29%**

Among recent drivers, 50% reported driving a vehicle within 3 hours of consuming illicit drugs and 29% while over the legal limit of alcohol.

Percentage who reported past year non-fatal depressant and stimulant overdose.

Percentage who obtained an AUDIT score of eight or more, indicative of past year hazardous alcohol use.

Two or more drugs **82%**  
Depressants & stimulants **29%**  
Depressants, stimulants & cannabis **14%**

In 2024, 82% reported using two or more drugs on the last occasion of ecstasy or related drug use: the most commonly used combination of drug classes was depressants and stimulants (29%).

## OTHER BEHAVIOURS

**58%**

Self reported MH issue

**36%**

Seen a MH professional

Percentage who self-reported mental health problems and treatment seeking in the six months preceding interview.

Anxiety **68%**  
Depression **62%**  
ADHD **25%**

Among those who reported a mental health problem, the three most common mental health issues were anxiety, depression and ADHD.

Percentage who reported that they or someone else had tested the content and/or purity of their illicit drugs in Australia in the past year.

28% of the sample reported experiencing stigma because of their illicit drug use in the six months preceding interview, most commonly from police.

## PAST 6 MONTH USE OF SELECT DRUGS

**Ketamine**

**LSD**

**Hallucinogenic mushrooms/psilocybin**

**GHB/GBL/1,4-BD**

**Amyl Nitrite**

**Nitrous oxide (nangs)**

**E-cigarettes**

# ECSTASY

## FORM of ecstasy

Past 6 month use of ecstasy capsules, crystal, pills, and powder in 2024.

Of those who had recently used any ecstasy, 17% reported weekly or more frequent use, stable from 2023 (14%).

2 Capsules

2 Pills

0.30 grams of crystal

0.30 grams of powder

Median amounts of ecstasy consumed in a 'typical' session.

In 2024, more participants perceived the availability of all forms of ecstasy as 'easy' or 'very easy' relative to 2023.

# METHAMPHETAMINE

## FORM of methamphetamine

Past 6 month use of any methamphetamine, crystal, powder and base in 2024.

Of those who had recently used any methamphetamine, 42% reported weekly or more frequent use, stable from 2023 (38%).

87%

Smoked crystal

77%

Snorted powder

87% of participants who had recently used crystal smoked it. Of those who had recently used powder, 77% snorted it.

Percentage who perceived crystal methamphetamine as being 'easy' or 'very easy' to obtain.

# COCAINE

Past 6 month use of any cocaine remained stable between 2023 and 2024.

Of those who had recently consumed cocaine, 12% reported weekly or more frequent use, stable from 2023 (9%).

\$350 \$350

2023

2024

The median reported price for a gram of cocaine.

Percentage who perceived cocaine as being 'easy' or 'very easy' to obtain.

# CANNABIS AND/OR CANNABINOID-RELATED PRODUCTS

Past 6 month use of non-prescribed cannabis and/or cannabinoid-related products was stable between 2023 and 2024.

Of those who had recently used non-prescribed cannabis, 62% reported weekly or more frequent use, stable from 2023 (58%).

Of participants who had consumed cannabis in the last 6 months, 90% had smoked it (31% swallowed and 25% vaped it).

Percentage who perceived cannabis/cannabinoid-related products as being 'easy' or 'very easy' to obtain (stable from 2023).

# 1

## Background and Methods

---

The Ecstasy and Related Drugs Reporting System (EDRS) interviews are conducted annually with a sentinel cross-sectional group of people who regularly use ecstasy and/or other stimulants, recruited from all capital cities of Australia (n=740 in 2024). The results from the EDRS interviews are not representative of all people who consume drugs, nor of illicit drug use in the general population, but this is not the aim of these data. Rather, these data are intended to provide evidence indicative of trends that warrant further monitoring. These findings should be interpreted alongside analyses of other data sources for a more complete profile of trends in illicit drug use, market features, and harms in Australia.

---

## Background

The [Ecstasy and Related Drugs Reporting System \(EDRS\)](#) is an illicit drug monitoring system which has been conducted in all states and territories of Australia since 2003, and forms part of [Drug Trends](#). The purpose is to provide a coordinated approach to monitoring the use, market features, and harms of ecstasy and related drugs. This includes drugs that are routinely used in the context of entertainment venues and other recreational locations, including ecstasy, methamphetamine, cocaine, new psychoactive substances, LSD (*d*-lysergic acid), and ketamine.

The EDRS is designed to be sensitive to emerging trends, providing data in a timely manner rather than describing issues in extensive detail. It does this by studying a range of data sources, including data from annual interviews with people who regularly use ecstasy and/or other illicit stimulants and from secondary analyses of routinely-collected indicator data. This report focuses on the key findings from the annual interview component of the EDRS.

## Methods

### EDRS 2003-2019

Full details of the [methods for the annual interviews](#) are available for download. To briefly summarise, since the commencement of monitoring up until 2019, participants were recruited primarily via internet postings, print advertisements, interviewer contacts, and snowballing (i.e., peer referral). Participants had to: i) be at least 17 years of age (due to ethical constraints) (16 years of age in Perth), ii) have used ecstasy and/or other illicit stimulants (including: MDA, methamphetamine, cocaine, non-prescribed pharmaceutical stimulants, mephedrone or other stimulant NPS) on at least six days during the preceding six months; and iii) have been a resident of the capital city in which the interview took place for ten of the past 12 months. Interviews took place in varied locations negotiated with participants (e.g., research institutions, coffee shops or parks), and in later years were conducted using REDCap (Research Electronic Data Capture), a software program to collect data on laptops or tablets. Following provision of written informed consent and completion of a structured interview, participants were reimbursed \$40 cash for their time and expenses incurred.

### EDRS 2020-2024: COVID-19 Impacts on Recruitment and Data Collection

Given the emergence of COVID-19 and the resulting restrictions on travel and people's movement in Australia (which first came into effect in March 2020), face-to-face interviews were not always possible due to the risk of infection transmission for both interviewers and participants. For this reason, all methods in 2020 were similar to previous years as detailed above, with the exception of:

1. Means of data collection: Interviews were conducted via telephone or via videoconferencing across all capital cities in 2020;
2. Means of consenting participants: Participants consent to participate was collected verbally prior to beginning the interview;
3. Means of reimbursement: Once the interview was completed via REDCap, participants were given the option of receiving \$40 reimbursement via one of three methods, comprising bank transfer, PayID or gift voucher; and

4. Age eligibility criterion: Changed from 17 years old (16 years old in Perth) to 18 years old.

From 2021 onwards, a hybrid approach was used with interviews conducted either face-to-face (whereby participants were reimbursed with cash) or via telephone/videoconference (with participants reimbursed via bank transfer or other electronic means). Face-to-face interviews were the preferred methodology, however telephone interviews were conducted when required (i.e., in accordance with government directives) or when requested by participants. Consent was collected verbally for all participants.

### 2024 EDRS Sample

Between 9 April-13 July 2024, a total of 740 participants were recruited across capital cities nationally. The sample sizes recruited from each capital city were: Sydney, NSW, n=100; Melbourne, VIC, n=100; Adelaide, SA, n=101; Canberra, ACT, n=100; Hobart, TAS, n=87; Brisbane and Gold Coast, QLD, n=101; Darwin, NT, n=51; and Perth, WA, n=100. Almost two-thirds of these interviews (65%; n= 482) were conducted via telephone/videoconference: Sydney, NSW, n=38; Melbourne, VIC, n=98; Adelaide, SA, n=42; Canberra, ACT, n=43; Hobart, TAS, n=76; Brisbane and Gold Coast, QLD, n=44; Darwin, NT, n=50; and Perth, WA, n=91.

Seven per cent of the 2024 national sample had taken part in the 2023 interview (7% of the 2023 sample had taken part in the 2022 interview;  $p=0.913$ ). There was a significant change in how participants found out about the study in 2024 compared to 2023 ( $p=0.003$ ), with fewer participants recruited via the internet (e.g., Facebook and Instagram) (72%; 78% in 2023), and more via word-of-mouth (23%; 19% in 2023).

### Data Analysis

For normally distributed continuous variables, means and standard deviations (SD) are reported; for skewed data (i.e., skewness  $> \pm 1$  or kurtosis  $> \pm 3$ ), medians and interquartile ranges (IQR) are reported. Tests of statistical significance have been conducted between estimates for 2023 and 2024, noting that no corrections for multiple comparisons have been made and thus comparisons should be treated with caution. Values where cell sizes are  $\leq 5$  have been suppressed with corresponding notation (zero values are reported). References to 'recent' use and behaviours refers to the six months preceding interview. The response options 'Don't know' and 'Skip question', which were available to select throughout the interview, was excluded from analysis.

In 2022 and 2023, there was considerable difficulty in recruiting participants from Darwin, Northern Territory (NT), despite extensive recruitment efforts and screening of interested people. Whilst it is difficult to provide a definitive reason for this, it seems that this was reflective of a disruption to drug markets in that jurisdiction, and a subsequent reduction in the frequency of ecstasy and other illicit stimulant use. Data from the NT EDRS are included in the national estimates but are not presented individually in jurisdictional tables for 2022 and 2023 (and 2010-2012) due to small numbers ( $n \leq 50$ ) reporting.

## Guide to Table/Figure Notes

Table 1: Guide to Table/Figure Notes

<b>Syd</b>	Sydney
<b>Can</b>	Canberra
<b>Mel</b>	Melbourne
<b>Hob</b>	Hobart
<b>Ade</b>	Adelaide
<b>Per</b>	Perth
<b>Dar</b>	Darwin
<b>Bri/GC</b>	Brisbane and the Gold Coast (and the Sunshine Coast 2014-16)

## Interpretation of Findings

Caveats to interpretation of findings are discussed more completely in the [methods for the annual interviews](#) but it should be noted that these data are from participants recruited in capital cities, and thus do not reflect trends in regional and remote areas. Further, the results are not representative of all people who consume illicit drugs, nor of illicit drug use in the general population, but rather are intended to provide evidence indicative of emerging issues that warrant further monitoring.

This report covers a subset of items asked of participants and does not include jurisdictional-level results beyond estimates of recent use of various substances (comprehensive jurisdictional findings are provided separately; see below), nor does it include implications of findings. These findings should be interpreted alongside analyses of other data sources for a more complete profile of emerging trends in illicit drug use, market features, and harms in Australia (see section on 'Additional Outputs' below for details of other outputs providing such profiles).

## Additional Outputs

[Infographics](#) from this report are available for download. There are a range of outputs from the EDRS which triangulate key findings from the annual interviews and other data sources, including [national reports](#), [jurisdictional reports](#), [bulletins](#), and other resources available via the [Drug Trends webpage](#). There are also results from the [Illicit Drug Reporting System \(IDRS\)](#), which focus more so on the use of illicit drugs via injection.

Please contact the research team at [drugtrends@unsw.edu.au](mailto:drugtrends@unsw.edu.au) with any queries, to request additional analyses using these data, or to discuss the possibility of including items in future interviews.

# 2

## Sample Characteristics

---

Participants were asked questions about select sociodemographic characteristics, as well as key drug use characteristics of interest.

---

## Sample Characteristics

Similar to previous years, the median age of the 2024 sample was 23 years (IQR=20-32; 25 years in 2023; IQR=21-32;  $p=0.526$ ). Gender remained stable ( $p=0.478$ ), with 55% of the sample identifying as male (58% in 2023) (Table 2). There was a significant change in participants' living situation between 2023 and 2024 ( $p=0.007$ ); almost half (48%) of participants reported living in a rented house/flat at the time of the interview, a decrease from 58% in 2023, and one third (34%) reported living with their parents/in their family home, an increase from 26% in 2023.

Whilst the mean years of school completed remained stable in 2024, relative to 2023 (12 years; range=7-12; 12 years in 2023; range=5-12;  $p=0.947$ ), the percentage of participants who reported having a post-school qualification(s) significantly decreased from 62% in 2023 to 56% in 2024 ( $p=0.024$ ).

Current employment status significantly changed between 2023 and 2024 ( $p=0.011$ ); almost one third (30%) reported being employed full-time at the time of interview, a decrease from 38% in 2023, and almost one quarter (23%) reported being unemployed (19% in 2023). Furthermore, 42% reported being employed on a part time/casual basis at the time of interview (39% in 2023), and fewer participants reported being self-employed at the time of interview (5%; 4% in 2023). The median weekly income in 2024 was \$700 (IQR=400-1200), significantly lower than what was reported in 2023 (\$808; IQR=450-1385;  $p=0.002$ ).

Note. ^ Includes trade/technical and university qualifications. # 'Current students' comprised participants who were currently studying for either trade/technical or university/college qualifications. + No fixed address included couch surfing and rough sleeping or squatting. Statistical significance for 2023 versus 2024 among the national sample presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes. For sample characteristics over the whole duration of the project, see [methods for the annual interviews](#).

Drug of choice significantly changed between 2023 and 2024 ( $p < 0.001$ ). Twenty-seven per cent of participants reported ecstasy as their drug of choice in 2024 (24% in 2023), with more participants nominating cannabis (25%; 20% in 2023) as their drug of choice. Whilst the per cent of participants nominating cocaine as their drug of choice remained unchanged (16%; 16% in 2023), fewer participants nominated alcohol as their drug of choice (4%; 8% in 2023), the lowest per cent observed since 2003 (Figure 1).

A significant change was also observed for the drug used most often in the past month ( $p < 0.001$ ). Specifically, there was a decrease in the percentage of participants who reported that alcohol was the drug used most often in the month preceding interview (13%; 22% in 2023), the lowest per cent observed since monitoring commenced in 2011, and an increase in the percentage of participants who reported that cannabis was the drug used most often in the month prior to interview (33%; 29% in 2023) (Figure 2).

Sixteen per cent of the sample reported weekly or more frequent use of ecstasy in 2024, stable relative to 2023 (13%;  $p = 0.121$ ). Weekly or more frequent use of methamphetamine remained stable in 2024 (10%; 11% in 2023;  $p = 0.553$ ), as did weekly or more frequent use of cocaine (10%; 8% in 2023;  $p = 0.144$ ) and non-prescribed cannabis (46%; 43% in 2023;  $p = 0.243$ ) (Figure 3).

Figure 1: Drug of choice, nationally, 2003-2024

Note. Participants could only endorse one substance. Substances listed in this figure are the primary endorsed; smaller percentages have endorsed other substances (in 2024, 2% endorsed hallucinogenic mushrooms and 3% endorsed pharmaceutical stimulants). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 2: Drug used most often in the past month, nationally, 2011-2024

Note. Participants could only endorse one substance. Substances listed in this figure are the primary endorsed; smaller percentages have endorsed other substances (in 2024, 5% endorsed ketamine, 5% endorsed pharmaceutical stimulants, 1% endorsed LSD and 1% endorsed hallucinogenic mushrooms/psilocybin). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 3: Weekly or more frequent substance use in the past six months, nationally, 2003-2024

Note. Computed from the entire sample regardless of whether they had used the substance in the past six months. Prior to 2021, we did not distinguish between prescribed and non-prescribed cannabis, and as such it is possible that 2017-2020 figures include some participants who were using prescribed cannabis only (with medicinal cannabis first legalised in Australia in November 2016), although we anticipate these numbers would be very low. Further, in 2022, we captured use of 'cannabis and/or cannabinoid-related products', while in previous years, questions referred only to 'cannabis'. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

# 3

## Non-Prescribed Ecstasy

---

Participants were asked about their recent (past six month) use of various forms of non-prescribed ecstasy (3,4-methylenedoxymethamphetamine), including pills, powder, capsules, and crystal.

---

## Patterns of Consumption (Any Ecstasy)

### Recent Use (past 6 months)

The majority (92%) of participants reported any recent use of non-prescribed ecstasy in 2024, stable relative to 2023 (95%;  $p=0.056$ ) (Figure 4). Similarly, non-prescribed ecstasy use remained stable in most capital cities, apart from a significant decrease in the Perth sample (89%; 98% in 2023;  $p=0.018$ ) (Table 3)

Consistent with the previous few years, capsules (59%) and crystal (48%) were the most commonly used forms of non-prescribed ecstasy in the six months preceding interview, followed by pills (43%). Powder remained the least commonly used form of non-prescribed ecstasy (30%), consistent with the entirety of the reporting period (Figure 4).

### Frequency of Use

In 2024, participants reported using non-prescribed ecstasy (in any form) on a median of eight days (IQR=4-16;  $n=682$ ), stable from 2023 (7 days; IQR=4-14;  $n=669$ ;  $p=0.600$ ), but lower than what has historically been observed (12-15 days between 2003 and 2020) (Figure 5). Among those who had recently used any non-prescribed ecstasy and commented ( $n=682$ ), weekly or more frequent use of any form of ecstasy remained stable in 2024 (17%), relative to 2023 (14%;  $p=0.086$ ).

### Number of Forms Used

Among participants who had recently consumed non-prescribed ecstasy and commented ( $n=683$ ), use of a median of two different forms of ecstasy were reported (IQR=1-3), significantly different from 2023 (2 forms; IQR=1-2;  $n=670$ ;  $p=0.033$ ). This was consistent across all capital cities, except in Canberra, where participants reported using a median of one form of ecstasy (IQR=1-2).

Figure 4: Past six month use of any non-prescribed ecstasy, and non-prescribed ecstasy pills, capsules, crystal, and powder, nationally, 2003-2024

Note. Up until 2012, participant eligibility was determined based on any recent ecstasy use; subsequently it has been expanded to broader illicit stimulant use. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 5: Median days of any non-prescribed ecstasy use, and non-prescribed ecstasy pills, powder, capsules and crystal use, in the past six months, nationally, 2003-2024

Note. Up until 2012, participant eligibility was determined based on any recent ecstasy use; subsequently it has been expanded to broader illicit stimulant use. Median days computed among those who reported past 6-month use (maximum 180 days). Median days rounded to the nearest whole number. Y axis reduced to 20 days to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Table 3: Past six month use of any non-prescribed ecstasy, by capital city, 2003-2024

Please refer to Table 1 for a guide to table/figure notes.

## Patterns of Consumption (by form)

### Non-Prescribed Ecstasy Pills

**Recent Use (past 6 months):** Recent use of non-prescribed ecstasy pills was reported by 43% of participants, unchanged from 2023 (43%;  $p=0.958$ ) (Figure 4). This was also stable across all capital city samples (Table 4).

**Frequency of Use:** Of those who had recently consumed non-prescribed ecstasy pills and commented ( $n=318$ ), participants reported a median of five days (IQR=2-12) of use in the six months preceding interview, stable relative to 2023 (4 days; IQR=2-10;  $n=304$ ;  $p=0.104$ ) (Figure 5). Among those who had recently used non-prescribed ecstasy pills, the percentage reporting weekly or more frequent use remained stable at 12% in 2024 (11% in 2023;  $p=0.895$ ).

**Routes of Administration:** Among participants who had recently consumed non-prescribed ecstasy pills and commented ( $n=318$ ), the most common route of administration was swallowing (98%; 96% in 2023;  $p=0.342$ ), followed by snorting (24%; 20% in 2023;  $p=0.248$ ).

**Quantity:** Of those who reported recent non-prescribed use and responded ( $n=317$ ), the median number of pills used in a 'typical' session was two (IQR=1-3; 2 pills in 2023; IQR=1-2;  $p=0.487$ ). Of those who reported recent use and responded ( $n=316$ ), the median maximum number of pills used in a session in 2024 was three (IQR=2-4; 3 pills in 2023; IQR=2-5;  $p=0.574$ ).

### Non-Prescribed Ecstasy Capsules

**Recent Use (past 6 months):** Capsules remained the most common form of non-prescribed ecstasy used in 2024, with 59% reporting recent use, stable relative to 2023

(59%;  $p=0.958$ ) (Figure 4). Recent use of ecstasy capsules remained stable in all capital city samples (Table 5).

**Frequency of Use:** Of those who had recently consumed non-prescribed ecstasy capsules and commented ( $n=438$ ), capsules were used on a median of four days (IQR=2-10), stable relative to 2023 (5 days; IQR=3-10;  $n=418$ ;  $p=0.679$ ) (Figure 5). Among those who had recently used non-prescribed ecstasy capsules, 6% reported weekly or more frequent use, stable from 2023 (6%).

**Routes of Administration:** Among participants who had recently consumed non-prescribed ecstasy capsules and commented ( $n=439$ ), swallowing remained the most common route of administration in 2024 (96%; 97% in 2023;  $p=0.463$ ). Sixteen per cent reported snorting capsules, stable relative to 2023 (18%;  $p=0.416$ ).

**Quantity:** Of those who reported recent non-prescribed use and responded ( $n=439$ ), the median number of capsules used in a 'typical' session in 2024 was two (IQR=1-3; 2 capsules in 2023; IQR=1-3;  $p=0.870$ ). Of those who reported recent use and responded ( $n=435$ ), the median maximum number of capsules used in a session was three (IQR=2-5; 3 capsules in 2023; IQR=2-5;  $p=0.806$ ).

### Non-Prescribed Ecstasy Crystal

**Recent Use (past 6 months):** Recent use of non-prescribed crystal was reported by nearly half (48%) of the national sample, stable from 50% in 2023 ( $p=0.597$ ) (Figure 4). Recent use of ecstasy crystal remained stable in all capital city samples (Table 6).

**Frequency of Use:** Of those who had recently consumed non-prescribed ecstasy crystal and commented ( $n=356$ ), participants reported use on a median of five days (IQR=2-10) in the six months preceding interview, stable from five

days in 2023 (IQR=3-10;  $n=350$ ;  $p=0.539$ ) (Figure 5). Among those who had recently used non-prescribed ecstasy crystal, 9% reported weekly or greater use, stable relative to 2023 (7%;  $p=0.486$ ).

**Routes of Administration:** Among participants who had recently consumed non-prescribed ecstasy crystal and commented ( $n=356$ ), the main route of administration reported was swallowing (78%; 81% in 2023;  $p=0.355$ ), followed by snorting (47%; 46% in 2023;  $p=0.757$ ).

**Quantity:** Of those who reported recent non-prescribed use and responded ( $n=301$ ), the median amount of crystal used in a 'typical' session was 0.30 grams (IQR=0.20-0.50; 0.30 grams in 2023; IQR=0.20-0.50;  $p=0.907$ ). Of those who reported recent use and responded ( $n=299$ ), the median maximum amount used in a session was 0.50 grams (IQR=0.30-1.00; 0.50 grams in 2023; IQR=0.30-1.00;  $p=0.975$ ).

### Non-Prescribed Ecstasy Powder

**Recent Use (past 6 months):** Consistent with previous years, non-prescribed powder was the least used form of ecstasy in 2024, with 30% of participants reporting recent use (28% in 2023;  $p=0.273$ ) (Figure 4). This was also stable across all capital city samples (Table 7).

**Frequency of Use:** Of those who had recently used non-prescribed ecstasy powder and commented ( $n=224$ ), powder was used on a median of four days (IQR=2-8) in the previous six months, stable relative to 2023 (4 days; IQR=2-7;  $n=193$ ;  $p=0.766$ ) (Figure 5). Among those who had recently used non-prescribed ecstasy powder, 8% reported weekly or more frequent use, stable from 2023 (5%;  $p=0.331$ ).

**Routes of Administration:** Among participants who had recently used non-prescribed ecstasy powder and commented

( $n=224$ ), snorting was the most common route of administration, consistent with previous years, and stable from 2023 (76%; 73% in 2023;  $p=0.431$ ). Half (50%) of the participants reported swallowing ecstasy powder, stable relative to 2023 (52%;  $p=0.771$ ).

**Quantity:** Of those who reported recent non-prescribed use and responded ( $n=171$ ), the median quantity of powder used in a 'typical' session was 0.30 grams (IQR=0.20-0.50; 0.30 grams in 2023; IQR=0.20-0.50;  $p=0.642$ ). Of those who reported recent use and responded ( $n=173$ ), the median maximum amount used in a session was 0.50 grams (IQR=0.30-1.00; 0.50 grams in 2023; IQR=0.30-1.00;  $p=0.721$ ).

## Price, Perceived Purity and Perceived Availability

### Non-Prescribed Ecstasy Pills

**Price:** The reported price of a non-prescribed pill in 2024 was \$30 (IQR=25-36;  $n=185$ ; \$30 in 2023; IQR=25-40;  $n=179$ ;  $p=0.149$ ) (Figure 6).

**Perceived Purity:** Among those who responded in 2024 ( $n=324$ ), the perceived purity of non-prescribed ecstasy pills remained stable relative to 2023 ( $p=0.975$ ). One third of participants reported the perceived purity to be 'high' (35%; 34% in 2023). Twenty-nine per cent reported 'medium' purity (30% in 2023), followed by 22% reporting 'fluctuating' purity (21% in 2023) and 14% reporting 'low' purity (14% in 2023) (Figure 8).

**Perceived Availability:** Among those who responded in 2024 ( $n=327$ ), there was a significant change in the perceived availability of non-prescribed ecstasy pills, relative to 2023 ( $p=0.003$ ). Thirty-five per cent of participants reported ecstasy pills to be 'very easy' to obtain, an increase from 28% in 2023, and 40% reported that they were 'easy' to obtain (35%

in 2023). In contrast, a decrease was observed in the percentage reporting that ecstasy pills were 'difficult' (21%; 30% in 2023) or 'very difficult' (4%; 7% in 2023) to obtain (Figure 12).

### Non-Prescribed Ecstasy Capsules

**Price:** The median price of a non-prescribed capsule was \$25 (IQR=25-30; n=239) in 2024, stable from \$30 (IQR=25-30; n=222) in 2023 ( $p=0.365$ ) (Figure 6).

**Perceived Purity:** Among those who responded in 2024 (n=436), a significant change was observed in the perceived purity of non-prescribed capsules, relative to 2023 ( $p=0.010$ ). There was an increase in the percentage of participants reporting 'high' (36%; 29% in 2023) purity, and a decline in those reporting 'medium' (31%; 39% in 2023) purity (Figure 9). Nearly one quarter (24%) reported perceived purity to be 'fluctuating' (19% in 2023), followed by 10% reporting 'low' purity (13% in 2023).

**Perceived Availability:** Among those who responded in 2024 (n=439), a significant change was observed in the perceived availability of non-prescribed capsules, relative to 2023 ( $p=0.001$ ). Specifically, there was an increase in the percentage of participants who reported availability to be 'very easy' (42%; 36% in 2023) or 'easy' (44%; 41% in 2023). In contrast, fewer participants reported ecstasy capsules as being 'difficult' (13%; 18% in 2023) or 'very difficult' (n=5; 5% in 2023) to obtain (Figure 13).

### Non-Prescribed Ecstasy Crystal

**Price:** The median price per gram of non-prescribed crystal significantly decreased to \$220 (IQR=163-270; n=195) from \$250 in 2023 (IQR=200-300; n=195;  $p=0.007$ ). The median price per point of crystal remained stable at

\$30 (IQR=30-80; n=9; \$25 in 2023; IQR=23-35; n=23;  $p=0.090$ ) (Figure 7).

**Perceived Purity:** Among those who responded in 2024 (n=338), the perceived purity of non-prescribed crystal remained stable relative to 2023 ( $p=0.198$ ). The largest percentage of participants reported perceived purity to be 'high' (49%; 45% in 2023). Fewer participants perceived purity to be 'medium' (27%; 29% in 2023), 'fluctuating' (18%; 17% in 2023) or 'low' (5%; 9% in 2023) (Figure 10).

**Perceived Availability:** Among those who responded in 2024 (n=339), the perceived availability of non-prescribed crystal changed significantly, relative to 2023 ( $p=0.005$ ). There was an increase in the percentage of participants who perceived crystal to be 'very easy' (42%; 33% in 2023) to obtain and a decrease in the percentage who reported that it was 'difficult' (17%; 24% in 2023) to obtain (Figure 14).

### Non-Prescribed Ecstasy Powder

**Price:** The reported median price per gram of non-prescribed powder remained stable at \$250 (IQR=175-300; n=80; \$250 in 2023; IQR=200-300; n=72;  $p=0.466$ ) (Figure 7), as did the reported median price per point of non-prescribed powder (\$30; IQR=25-55; n=7; \$25 in 2023; IQR=20-30; n=13;  $p=0.227$ ).

**Perceived Purity:** Among those who responded in 2024 (n=170), the perceived purity of non-prescribed powder remained stable, relative to 2023 ( $p=0.609$ ). Thirty-six per cent perceived ecstasy powder to be of 'medium' purity (42% in 2023), 35% perceived it as 'high' (29% in 2023) and 13% perceived powder to be 'low' in purity (14% in 2023) (Figure 11).

**Perceived Availability:** Among those who responded in 2024 (n=169), the perceived

availability of non-prescribed powder significantly changed, relative to 2023 ( $p < 0.001$ ). An increase was observed in those reporting availability to be 'very easy' (34%;

22% in 2023). In contrast, a decrease was observed in those who reported availability as being 'very difficult' ( $n \leq 5$ ; 10% in 2023) (Figure 15).

# 4

## Methamphetamine

---

Participants were asked about their recent (past six month) use of various forms of methamphetamine, including powder (white particles, described as 'speed'), base (wet, oily powder), and crystal (clear, ice-like crystals).

---

## Patterns of Consumption (Any Methamphetamine)

### Recent Use (past 6 months)

The per cent reporting any recent use of methamphetamine has been declining since monitoring commenced (Figure 16). One quarter (25%) reported recent use of any methamphetamine in 2024, a significant decrease from 30% in 2023 ( $p=0.037$ ) (Figure 16). This was largely driven by significant decreases in the Perth (9%; 29% in 2023;  $p<0.001$ ) and Adelaide (26%; 46% in 2023;  $p=0.006$ ) samples (Table 8).

### Frequency of Use

Participants reported use on a median of ten days (IQR=2-74;  $n=183$ ) in 2024 (8 days in 2023; IQR=2-50;  $n=212$ ;  $p=0.180$ ) (Figure 17). Among those who had recently used methamphetamine ( $n=183$ ), two fifths (42%) reported weekly or more frequent use, stable from 38% in 2023 ( $p=0.465$ ).

### Forms Used

Of participants who had used methamphetamine in the six months preceding interview in 2024 ( $n=184$ ), two thirds had used methamphetamine crystal (66%; 73% in 2023;  $p=0.132$ ), half had used methamphetamine powder (47%; 37% in 2023;  $p=0.069$ ) and one tenth had used methamphetamine base (9%; 7% in 2023;  $p=0.461$ ).

### Number of Forms Used

Among participants who had recently consumed any methamphetamine and commented ( $n=184$ ), the median number of forms used was one (IQR=1-1), stable from 2023 (1 form; IQR=1-1;  $n=212$ ;  $p=0.431$ ). This was consistent across jurisdictions.

Figure 16: Past six month use of any methamphetamine, and methamphetamine powder, base, and crystal, nationally, 2003-2024

Note. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 17: Median days of any methamphetamine use, and methamphetamine powder, base and crystal in the past six months, nationally, 2003-2024

Note. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Y axis reduced to 50 days to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Statistical significance for 2023 versus 2024 presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Patterns of Consumption (by form)

### Methamphetamine Powder

**Recent Use (past 6 months):** Powder was historically the most commonly used form of methamphetamine, however, has declined substantially since 2003 and was overtaken by crystal from 2021 onwards (Figure 16). In 2024, 12% of the national sample reported recent use, stable relative to 2023 (11%;  $p=0.800$ ). This was also stable across all capital cities (Table 9).

**Frequency of Use:** Of those who had recently consumed powder and commented ( $n=86$ ), median days of use remained low and stable at two days in 2024 (IQR=1-6; 2 days in 2023; IQR=1-6;  $n=79$ ;  $p=0.476$ ) (Figure 17), with 13% reporting weekly or more frequent use (11% in 2023;  $p=0.809$ ).

**Routes of Administration:** Among participants who had recently consumed powder and commented ( $n=86$ ), the main route of administration in 2024 was snorting (77%; 68% in 2023;  $p=0.290$ ), followed by swallowing (23%; 33% in 2023;  $p=0.227$ ). Fewer participants reported smoking (10%; 16% in 2023;  $p=0.361$ ).

**Quantity:** Of those who reported recent use and responded ( $n=66$ ), the median amount used in a 'typical' session was 0.40 grams (IQR=0.20-0.50; 0.28 grams in 2023; IQR=0.11-0.50;  $p=0.295$ ). Of those who reported recent use and responded ( $n=64$ ), the median maximum amount used in a session was 0.50 grams (IQR=0.20-1.00; 0.50 grams in 2023; IQR=0.16-1.00;  $p=0.692$ ).

### Methamphetamine Crystal

**Recent Use (past 6 months):** As with all forms of methamphetamine, crystal use has generally

decreased over time (Figure 16). In 2024, 16% of the national sample had recently consumed crystal, a significant decrease relative to 2023 (22%;  $p=0.010$ ). This was largely driven by significant decreases in the Perth (8%; 28% in 2023;  $p<0.001$ ) and Adelaide (23%; 39% in 2023;  $p=0.025$ ) samples (Table 10).

**Frequency of Use:** Of those who had recently consumed crystal and commented ( $n=120$ ), participants reported use on a median of 42 days (IQR=10-96) (Figure 17), a significant increase from 20 days in 2023 (IQR=4-72;  $n=155$ ;  $p=0.008$ ) and the highest median days of use observed since the commencement of monitoring. Among those who had recently consumed crystal and commented ( $n=120$ ), three fifths (60%) reported weekly or more frequent use in 2024 (48% in 2023;  $p=0.053$ ).

**Routes of Administration:** Among those who had recently used crystal and commented ( $n=121$ ), smoking remained the most common route of administration in 2024 (87%; 88% in 2023;  $p=0.718$ ), with fewer participants reporting snorting (15%; 10% in 2023;  $p=0.273$ ), injecting (14%; 13% in 2023;  $p=0.854$ ) or swallowing (12%; 12% in 2023).

**Quantity:** Of those who reported recent use and responded ( $n=113$ ), the median amount used in a 'typical' session was 0.20 grams (IQR=0.10-0.50; 0.20 grams in 2023; IQR=0.10-0.50;  $p=0.821$ ). Of those who reported recent use and responded ( $n=109$ ), the median maximum amount used in a session was 0.50 grams (IQR=0.20-1.00; 0.50 grams in 2023; IQR=0.20-1.00;  $p=0.711$ ).

## Price, Perceived Purity and Perceived Availability

### Methamphetamine Powder

**Price:** Participants reported a median price of \$200 per gram of methamphetamine powder in 2024 (IQR=200-210; n=25; \$210 in 2023; IQR=185-250; n=26;  $p=0.311$ ) and \$50 for one point (IQR=48-100; n=12; \$50 in 2023; IQR=40-150; n=9;  $p=0.857$ ) (Figure 18).

**Perceived Purity:** Among those who responded in 2024 (n=72), the perceived purity of powder remained stable, relative to 2023 ( $p=0.817$ ). The largest percentage of participants perceived powder to be of 'high' purity (40%; 47% in 2023), with a further 32% perceiving powder to be of 'medium' purity (26% in 2023) (Figure 20). Fewer participants perceived purity to be 'low' (17%; 15% in 2023).

**Perceived Availability:** Among those who responded in 2024 (n=72), the perceived availability of powder remained stable, relative to 2023 ( $p=0.124$ ). One third perceived powder to be 'difficult' to obtain (19% in 2023), while 29% perceived it to be 'easy' to obtain (23% in 2023), and 28% perceived it to be 'very easy' to obtain (45% in 2023) (Figure 22).

### Methamphetamine Crystal

**Price:** Participants reported a median price of \$300 per gram of methamphetamine crystal (IQR=250-450; n=27), remaining stable relative to 2023 (\$300; IQR=238-400; n=32;  $p=0.403$ ). The price per point of crystal was reported to be \$50 (IQR=50-80; n=43), also stable relative to 2023 (\$50; IQR=45-68; n=54;  $p=0.200$ ) (Figure 19).

**Perceived Purity:** Among those who responded in 2024 (n=125), the perceived purity of crystal remained stable, relative to 2023 ( $p=0.195$ ). Two fifths (43%) perceived crystal to be of 'high' purity (47% in 2023), followed by one quarter (25%) perceiving it to be of 'medium' purity (32% in 2023) and one fifth (20%) perceiving crystal to be of 'fluctuating' purity (15% in 2023) (Figure 21).

**Perceived Availability:** Among those who responded in 2024 (n=127), the perceived availability of crystal remained stable, relative to 2023 ( $p=0.962$ ). The largest per cent (65%) reported availability to be 'very easy' (68% in 2023), and 28% reported it to be 'easy' (27% in 2023) (Figure 23).

# 5

## Non-Prescribed Pharmaceutical Stimulants

---

Participants were asked about their recent (past six month) use of non-prescribed pharmaceutical stimulants, such as dexamfetamine, lisdexamfetamine (Vyvanse<sup>®</sup>), or methylphenidate (Concerta<sup>®</sup>, Ritalin<sup>®</sup>, Ritalin LA<sup>®</sup>). These substances are commonly prescribed to treat attention deficit hyperactivity disorder and narcolepsy.

---

## Patterns of Consumption

### Recent Use (past 6 months)

The per cent of participants reporting any recent non-prescribed pharmaceutical stimulant (e.g., dexamphetamine, methylphenidate, modafinil) use has steadily increased since the commencement of monitoring, from 17% in 2007 to 52% in 2022. Recent use of non-prescribed pharmaceutical stimulants then declined in 2023 (47%), before increasing in 2024 (54%;  $p=0.010$ ) and returning to similar levels of use observed in 2022 (Figure 24). The significant increase in 2024, relative to 2023, was largely driven by a significant increase in the percentage reporting recent use in the Brisbane/Gold Coast sample (61%; 41% in 2023;  $p=0.005$ ) (Table 11).

### Frequency of Use

Frequency of use remained stable in 2024 at a median of six days in the six months prior to interview (IQR=3-20;  $n=398$ ; 6 days in 2023; IQR=2-15;  $n=331$ ;  $p=0.087$ ) (Figure 24).

### Routes of Administration

Among participants who had recently consumed non-prescribed pharmaceutical stimulants and commented ( $n=399$ ), the vast majority reported swallowing as a route of administration (94%; 94% in 2023;  $p=0.873$ ), although there was a significant increase in the per cent who reported snorting as a route of administration (26%; 20% in 2023;  $p=0.045$ ).

### Quantity

Among those who reported recent use and responded ( $n=316$ ), the median amount used in a 'typical' session was two pills/tablets (IQR=1-3; 2 pills/tablets in 2023; IQR=1-3;  $p=0.606$ ). Of those who reported recent use and responded ( $n=319$ ), the median maximum amount used in a session was three pills/tablets (IQR=2-5.5; 3 pills/tablets in 2023; IQR=2-6;  $p=0.759$ ).

### Forms Used

Among participants who had recently consumed non-prescribed pharmaceutical stimulants and commented ( $n=397$ ), the majority reported using dexamfetamine (82%; 80% in 2023;  $p=0.558$ ), with fewer participants reporting use of Ritalin<sup>®</sup> (39%; 35% in 2023;  $p=0.354$ ) and lisdexamfetamine (22%; 20% in 2023;  $p=0.414$ ). Nine per cent reported recent use of modafinil (13% in 2023;  $p=0.123$ ).

Note. Monitoring of pharmaceutical stimulants commenced in 2007. ~Due to the particularly small samples ( $n < 50$ ) recruited in Darwin in 2010-2013 and 2022-2023, data from these years are not presented in this table; furthermore, data from Darwin in 2006, 2008 and 2024 should be interpreted with caution due to small samples (2006:  $n = 51$ ; 2008:  $n = 55$ ; 2024:  $n = 51$ ). Statistical significance for 2023 versus 2024 presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Price and Perceived Availability

Price and availability data for non-prescribed pharmaceutical stimulants have been collected from 2022 onwards.

### Price

Participants reported a median price of \$5 per 5mg tablet in 2024 (IQR=5-9; n=95; \$6 in 2023; IQR=5-10; n=93;  $p=0.029$ ) and \$5 per 10mg tablet (IQR=3-10; n=26; \$9 in 2023; IQR=5-10; n=26;  $p=0.224$ ). Participants reported a median price of \$8 per 20mg tablet in 2024 (IQR=5-21; n=8; \$10 in 2023; IQR=8-13;  $n\leq 5$ ).

### Perceived Availability

Among those who responded in 2024 (n=260), the perceived availability of non-prescribed pharmaceutical stimulants remained stable, relative to 2023 ( $p=0.530$ ). The largest percentage of participants perceived non-prescribed pharmaceutical stimulants as being 'very easy' to obtain (46%; 52% in 2023), followed by a further one third (33%) perceiving it to be 'easy' to obtain (30% in 2023). Seventeen per cent reported availability to be 'difficult' to obtain in 2023 (14% in 2023) (Figure 25)

**Figure 25: Current perceived availability of non-prescribed pharmaceutical stimulants, nationally, 2022-2024**

Note. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

# 6

## Cocaine

---

Participants were asked about their recent (past six month) use of various forms of cocaine, including powder and crack/rock cocaine. Cocaine hydrochloride, a salt derived from the coca plant, is the most common form of cocaine available in Australia. 'Crack' cocaine is a form of freebase cocaine (hydrochloride removed), which is particularly pure. 'Crack' is most prevalent in North America and infrequently encountered in Australia.

---

## Patterns of Consumption

### Recent Use (past 6 months)

Recent cocaine use increased threefold between 2003 and 2021, however has remained stable from 2021 onwards. In 2024, four fifths (80%) of the national sample reported recent use, stable from 2023 (81%;  $p=0.747$ ) (Figure 25). In line with the national data, recent cocaine use remained high and stable among all capital city samples (Table 12).

### Frequency of Use

Of those who had recently consumed cocaine and commented in 2024 ( $n=592$ ), participants reported a median of five days of use in the six months preceding interview (IQR=2-11; 5 days in 2023; IQR=2-10;  $n=572$ ;  $p=0.715$ ) (Figure 25), equivalent to less than monthly use. One tenth (12%) of those who had recently used cocaine reported weekly or more frequent use, stable relative to 2023 (9%;  $p=0.138$ ).

### Routes of Administration

Among participants who had recently consumed cocaine and commented ( $n=592$ ), the vast majority reported snorting as a route of administration (98%; 98% in 2023;  $p=0.673$ ), with fewer participants reporting swallowing (10%; 7% in 2023;  $p=0.069$ ).

### Quantity

Among those who reported recent use and responded ( $n=401$ ), the median amount used in a 'typical' session was 0.50 grams (IQR=0.25-1.00; 0.50 grams in 2023; IQR=0.35-1.00;  $p=0.007$ ). Of those who reported recent use and responded ( $n=402$ ), the median maximum amount used in a session was 0.80 grams (IQR=0.40-1.50; 1.00 gram in 2023; IQR=0.50-1.50;  $p=0.063$ ).

### Forms Used

Among participants who had recently consumed cocaine and commented ( $n=591$ ), the vast majority of participants reported using powder cocaine (95%; 94% in 2023;  $p=0.438$ ), followed by crack/rock cocaine (9%; 11% in 2023;  $p=0.299$ ).

Figure 26: Past six month use and frequency of use of cocaine, nationally, 2003-2024

Note. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Secondary Y axis reduced to 10 days to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Note. ~Due to the particularly small samples ( $n < 50$ ) recruited in Darwin in 2010-2013 and 2022-2023, data from these years are not presented in this table; furthermore, data from Darwin in 2006, 2008 and 2024 should be interpreted with caution due to small samples (2006:  $n=51$ ; 2008:  $n=55$ ; 2024:  $n=51$ ). Statistical significance for 2023 versus 2024 presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Price, Perceived Purity and Perceived Availability

### Price

Participants reported a median price of \$350 per gram of cocaine (IQR=300-400;  $n=302$ ), stable from 2023 (\$350 in 2023; IQR=300-400;  $n=310$ ;  $p=0.513$ ), but remaining higher than the median price reported between 2003-2020 (Figure 26).

### Perceived Purity

Among those able to comment in 2024 ( $n=489$ ), the perceived purity of cocaine significantly changed, relative to 2023 ( $p=0.012$ ). Fewer participants perceived purity to be 'low' (26%; 36% in 2023) and more participants perceived purity to be 'medium' (31%; 27% in 2023) and 'high' (26%; 21% in 2023). Seventeen per cent perceived purity to be 'fluctuating' (16% in 2023) (Figure 27).

### Perceived Availability

Among those able to comment in 2024 ( $n=487$ ), the perceived availability of cocaine remained stable relative to 2023 ( $p=0.695$ ). The largest percentage of participants perceived availability to be 'easy' to obtain (42%; 43% in 2023), followed by 'very easy' (39%; 37% in 2023). Seventeen per cent of participants reported cocaine as being 'difficult' to obtain in 2024 (18% in 2023) (Figure 28).

# 7

## Cannabis and/or Cannabinoid-Related Products

---

Participants were asked about their recent (past six month) use of various forms of cannabis, including indoor-cultivated cannabis via a hydroponic system ('hydroponic'), outdoor-cultivated cannabis ('bush'), hashish, hash oil, commercially prepared edibles and CBD and THC extract.

Terminology throughout this chapter refers to **prescribed use**: use of cannabis and/or cannabinoid-related products obtained by a prescription in the person's name; **non-prescribed use**: use of cannabis and/or cannabinoid-related products which the person did not have a prescription for (i.e., illegally sourced or obtained from a prescription in someone else's name); and **any use**: use of cannabis and/or cannabinoid-related products obtained through either of the above means.

---

## Patterns of Consumption

Participants were asked about their use of both prescribed and non-prescribed cannabis and/or cannabinoid-related products. One in ten participants (11%;  $n=84$ ) reported prescribed use in the six months preceding interview, a significant increase relative to 2023 (6%;  $p<0.001$ ).

In the remainder of this chapter, data from 2021-2024, and between 2003-2016, refers to non-prescribed cannabis use only, while data between 2017-2020 refers to 'any' cannabis use (including hydroponic and bush cannabis, hash and hash oil). While comparison between 2021-2024 and previous years should be treated with caution, the relatively recent legalisation of medicinal cannabis in Australia and the small percentage reporting prescribed use between 2022 and 2024 lends confidence that estimates are relatively comparable.

### Recent Use (past 6 months)

In 2024, 75% of the national sample reported recent use of non-prescribed cannabis and/or cannabinoid-related products (74% in 2023;  $p=0.851$ ) (Figure 29). In line with the national data, there were no significant changes by capital city (Table 13).

### Frequency of Use

Frequency of use has varied between weekly and several times a week over the course of monitoring. Of those who had recently consumed non-prescribed cannabis and/or cannabinoid-related products and commented ( $n=554$ ), participants reported a median of 48 days of use (IQR=8-180) in 2024 (30 days in 2023; IQR=6-144;  $n=526$ ;  $p=0.083$ ) (Figure 29). Three fifths (62%) of those who had recently used non-prescribed cannabis and/or cannabinoid-related products reported weekly or more frequent use (58% in 2023;  $p=0.218$ ), including one quarter (26%) who reported daily use (22% in 2023;  $p=0.142$ ).

### Routes of Administration

Among participants who had recently consumed non-prescribed cannabis and/or cannabinoid-related products and commented ( $n=554$ ), the majority (90%) reported smoking as a route of administration (94% in 2023;  $p=0.062$ ). Almost one third (31%) reported swallowing (30% in 2023;  $p=0.797$ ) and one quarter (25%) reported inhaling/vaporising non-prescribed cannabis, a significant increase from 17% in 2023 ( $p=0.003$ ).

### Quantity

Of those who reported recent non-prescribed cannabis use, the median 'typical' amount used on the last occasion of use was one gram (IQR=0.50-2.00;  $n=166$ ; 1 gram in 2023; IQR=0.50-2.00;  $n=170$ ;  $p=0.913$ ), two cones (IQR=1-4;  $n=188$ ; 2 cones in 2023; IQR=1-4;  $n=150$ ;  $p=0.673$ ) or one joint (IQR=0.5-1;  $n=118$ ; 1 joint in 2023; IQR=0.5-1;  $n=132$ ;  $p=0.948$ ).

### Forms Used

Among participants who had recently consumed non-prescribed cannabis and/or cannabinoid-related products and commented ( $n=480$ ), 69% reported recent use of hydroponic cannabis, a significant increase relative to 2023 (63%;  $p=0.037$ ) and 53% reported recent use of outdoor-grown 'bush' (51% in 2023;  $p=0.603$ ). In 2024, 10% of participants reported they had used hashish (9% in 2023;  $p=0.657$ ), and 9% had used hash oil (7% in 2023;  $p=0.228$ ) in the preceding six months. Sixteen

per cent of participants reported recent use of commercially prepared edibles in 2024 (14% in 2023;  $p=0.406$ ), 10% reported recent use of non-prescribed CBD extract (7% in 2023;  $p=0.065$ ), and 18% reported use of non-prescribed THC extract (13% in 2023;  $p=0.063$ ) (Figure 31).

Figure 30: Past six month use and frequency of use of non-prescribed cannabis and/or cannabinoid-related products, nationally, 2003-2024

Note. Prior to 2021, we did not distinguish between prescribed and non-prescribed cannabis, and as such it is possible that 2017-2020 figures include some participants who were using prescribed cannabis only (with medicinal cannabis first legalised in Australia in November 2016), although we anticipate these numbers would be very low (e.g., in 2022, 10 participants reported use of prescribed cannabis only). Further, from 2022 onwards, we captured use of 'cannabis and/or cannabinoid-related products', while in previous years questions referred only to 'cannabis'. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Price, Perceived Potency and Perceived Availability

### Hydroponic Cannabis

**Price:** The median price per gram of non-prescribed hydroponic cannabis in 2024 was \$20 (IQR=15-25; n=64; \$20 in 2023; IQR=20-25; n=50;  $p=0.514$ ). The median price per ounce of non-prescribed hydroponic cannabis was \$300 (IQR=250-350; n=67), unchanged relative to 2023 (\$300; IQR=250-400; n=57;  $p=0.268$ ) (Figure 32A).

**Perceived Potency:** Among those that were able to comment in 2024 (n=310), the perceived potency of non-prescribed hydroponic cannabis remained stable, relative to 2023 ( $p=0.275$ ). The majority (59%) of participants reported potency to be 'high' (51% in 2023), and 24% reported potency to be 'medium' (29% in 2023) (Figure 33A).

**Perceived Availability:** Among those that were able to comment in 2024 (n=312), the perceived availability of non-prescribed hydroponic cannabis remained stable, relative to 2023 ( $p=0.111$ ). The majority (66%) of participants reported non-prescribed hydroponic cannabis to be 'very easy' to obtain (73% in 2023), and 31% reported that it was 'easy' to obtain (23% in 2023) (Figure 34A).

### Bush Cannabis

**Price:** The median price per gram of non-prescribed bush cannabis in 2024 was \$20 (IQR=12-21; n=36; \$20 in 2023; IQR=18-25; n=46;  $p=0.198$ ). The median price for an ounce of non-prescribed bush cannabis was \$250 (IQR=200-300; n=58; \$250 in 2023; IQR=210-290; n=35;  $p=0.670$ ) (Figure 32B).

**Perceived Potency:** Among those that were able to comment in 2024 (n=202), the perceived potency of non-prescribed bush cannabis remained stable, relative to 2023 ( $p=0.426$ ). Most participants reported potency as 'medium' (42%; 38% in 2023) and a further 29% reported 'high' potency (37% in 2023). Fifteen per cent reported potency to be 'fluctuating' (13% in 2023), and 14% reported it to be 'low' (11% in 2023) (Figure 33B).

**Perceived Availability:** Among those that were able to comment in 2024 (n=204), the perceived availability of non-prescribed bush cannabis remained stable, relative to 2023 ( $p=0.276$ ). Most participants perceived non-prescribed bush cannabis as being 'very easy' to obtain (63%; 70% in 2023), and 28% perceived it as being 'easy' (25% in 2023) to obtain. Fewer participants perceived it as being 'difficult' (7%; 5% in 2023) to obtain in 2024 (Figure 34B).

**Figure 32: Median price of non-prescribed hydroponic (A) and bush (B) cannabis per ounce and gram, nationally, 2006-2024**

**(A) Hydroponic cannabis**

**(B) Bush cannabis**

Note. From 2006 onwards hydroponic and bush cannabis data collected separately. The error bars represent the IQR. Data from 2022 onwards refers to non-prescribed cannabis only: prior to 2022, we did not distinguish between prescribed and non-prescribed cannabis, and as such it is possible that 2017-2021 figures include some participants who reported on the price of prescribed cannabis (with medicinal cannabis first legalised in Australia in November 2016), although we anticipate these numbers would be very low. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

# 8

## Ketamine, LSD and DMT

---

Participants were asked about their recent (past six month) use of various forms of non-prescribed ketamine, lysergic acid diethylamide (LSD) and N,N-Dimethyltryptamine (DMT).

---

## Non-Prescribed Ketamine

### Patterns of Consumption

**Recent Use (past 6 months):** The per cent of the sample reporting recent use of non-prescribed ketamine declined from 2003-2009, followed by an overall increase from 2009-2021, after which the per cent reporting recent use largely stabilised. In 2024, 53% of the national sample reported recent use, stable relative to 2023 (49%;  $p=0.135$ ) (Figure 35). A significant increase was observed in the Perth (55%; 36% in 2023;  $p=0.014$ ) and Brisbane/Gold Coast (52%; 35% in 2023;  $p=0.017$ ) samples, though a significant decrease was observed in the Hobart sample (30%; 51% in 2023;  $p=0.013$ ) (Table 14).

**Frequency of Use:** Of those who had recently consumed non-prescribed ketamine and commented in 2024 ( $n=391$ ), participants reported a median of four days of use in the six months preceding interview (IQR=2-12; 4 days in 2023; IQR=2-8;  $n=345$ ;  $p=0.044$ ) (Figure 35). One tenth (12%) of those who had recently used non-prescribed ketamine reported weekly or more frequent use (8% in 2023;  $p=0.066$ ).

**Routes of Administration:** Among participants who had recently consumed non-prescribed ketamine and commented ( $n=391$ ), the most common route of administration was snorting (94%; 95% in 2023;  $p=0.749$ ), followed by swallowing (9%; 6% in 2023;  $p=0.137$ ). Few participants ( $n\leq 5$ ) reported smoking and injecting; therefore, these numbers are suppressed.

**Quantity:** Among those who reported recent use and responded ( $n=275$ ), the median amount used in a 'typical' session was 0.25 grams (IQR=0.15-0.50; 0.25 grams in 2023; IQR=0.20-0.50;  $p=0.582$ ). Among those who reported recent use and responded ( $n=280$ ), the median maximum quantity used in a session was 0.50 grams (IQR=0.20-1.00; 0.50 grams in 2023; IQR=0.25-1.00;  $p=0.954$ ).

Figure 35: Past six month use and frequency of use of non-prescribed ketamine, nationally, 2003-2024

Note. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Secondary Y axis reduced to 10 days to improve visibility of trends. Data from 2023 onwards refers to non-prescribed ketamine only (noting that although ketamine has been used as an anaesthetic for many years, it only become available via prescription, for treatment resistant depression, in 2021). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Table 14: Past six month use of non-prescribed ketamine, by capital city, 2003-2024

%	Syd	Can	Mel	Hob	Ade	Per	Dar	Bri/GC
2003	49	21	51	24	36	12	7	14
2004	39	15	45	-	39	10	18	16
2005	39	17	35	11	24	11	7	20
2006	27	15	29	6	11	-	-	12
2007	36	10	25	14	26	-	-	-
2008	30	6	20	6	20	-	0	-
2009	19	-	21	-	19	6	0	6
2010	24	6	23	6	13	-	~	8
2011	39	14	26	8	8	0	~	-
2012	24	14	35	-	10	-	~	7
2013	24	33	46	9	6	7	~	13
2014	23	6	63	14	-	11	15	-
2015	24	9	50	-	-	-	18	-
2016	50	20	72	-	15	18	11	22
2017	50	49	80	17	48	16	11	21
2018	54	29	90	23	24	22	11	28
2019	68	33	84	17	33	25	39	27
2020	53	47	78	52	32	31	24	28
2021	76	51	81	46	28	41	55	37
2022	56	39	88	38	29	39	~	51
2023	54	56	82	51	37	36	~	35
2024	61	46	80	30*	49	55*	41	52*

Note. Data from 2023 onwards refers to non-prescribed ketamine only (noting that although ketamine has been used as an anaesthetic for many years, it only become available via prescription, for treatment resistant depression, in 2021). ~Due to the particularly small samples ( $n < 50$ ) recruited in Darwin in 2010-2013 and 2022-2023, data from these years are not presented in this table; furthermore, data from Darwin in 2006, 2008 and 2024 should be interpreted with caution due to small samples (2006:  $n=51$ ; 2008:  $n=55$ ; 2024:  $n=51$ ). Statistical significance for 2023 versus 2024 presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$  (except for Darwin). Please refer to Table 1 for a guide to table/figure notes.

### Price, Perceived Purity and Perceived Availability

**Price:** In 2024, participants reported a median price of \$200 (IQR=180-250;  $n=169$ ) per gram of non-prescribed ketamine, a significant decrease relative to 2023 (\$250; IQR=200-258;  $n=150$ ;  $p=0.040$ ) representing a return to a similar median price per gram of ketamine observed between 2014-2020 (Figure 36).

**Perceived Purity:** Among those able to comment in 2024 ( $n=294$ ), the perceived purity of non-prescribed ketamine remained stable, relative to 2023 ( $p=0.823$ ). Three fifths (62%) perceived purity as being 'high' (65% in 2023), and one fifth (20%) perceived purity as being of 'medium' purity (19% in 2023) (Figure 37).

**Perceived Availability:** Of those able to comment in 2024 ( $n=293$ ), the perceived availability of non-prescribed ketamine remained stable, relative to 2023 ( $p=0.268$ ). Two fifths (40%) perceived non-prescribed ketamine to be 'easy' to obtain (41% in 2023), followed by one third (33%) perceiving it to be 'very easy' to obtain (27% in 2023). Almost one quarter (23%) perceived ketamine to be 'difficult' to obtain in 2024 (25% in 2023) (Figure 38).

Figure 36: Median price of non-prescribed ketamine per gram, nationally, 2003-2024

Note. Among those who commented. The error bars represent the IQR. Data from 2023 onwards refers to non-prescribed ketamine only (noting that although ketamine has been used as an anaesthetic for many years, it only become available via prescription, for treatment resistant depression, in 2021). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 37: Current perceived purity of non-prescribed ketamine, nationally, 2003-2024

Note. Data from 2023 onwards refers to non-prescribed ketamine only (noting that although ketamine has been used as an anaesthetic for many years, it only become available via prescription, for treatment resistant depression, in 2021). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 38: Current perceived availability of non-prescribed ketamine, nationally, 2003-2024

Note. Data from 2023 onwards refers to non-prescribed ketamine only (noting that although ketamine has been used as an anaesthetic for many years, it only become available via prescription, for treatment resistant depression, in 2021). Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## LSD

### Patterns of Consumption

**Recent Use (past 6 months):** The per cent reporting any recent use of LSD gradually increased between 2003 and 2017, stabilised between 2017 and 2021, and has been gradually declining from 2021 onwards. In 2024, 36% of the national sample reported recent use of LSD, stable relative to 2023 (41%;  $p=0.099$ ) (Figure 39). A significant decrease was observed among the Melbourne sample (38%; 55% in 2023;  $p=0.026$ ), however remained stable in all other capital cities (Table 15).

**Frequency of Use:** Of those who had recently consumed LSD and commented ( $n=269$ ), use was infrequent and stable, with participants reporting use on a median of two days (IQR=1-5) in 2024 (2 days in 2023; IQR=1-4;  $n=289$ ;  $p=0.498$ ) (Figure 39). Three per cent of those who had recently used LSD reported weekly or more frequent use (2% in 2023).

**Routes of Administration:** Among participants who had recently consumed LSD and commented ( $n=269$ ), 99% of participants reported swallowing (100% in 2023;  $p=0.232$ ). Few participants reported any other routes of administration.

**Quantity:** Among those who reported recent use and responded ( $n=187$ ), the median amount used in a 'typical' session was one tab (IQR=1.00-2.00; 1 tab in 2023; IQR=0.80-1.00;  $p=0.034$ ). Among those who reported recent use and responded ( $n=185$ ), the median maximum amount used in a session was one tab (IQR=1.00-2.00; 1 tab in 2023; IQR=1.00-2.00;  $p=0.068$ ).

Figure 39: Past six month use and frequency of use of LSD, nationally, 2003-2024

Note. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Secondary Y axis reduced to 10 days to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Table 15: Past six month use of LSD, by capital city, 2003-2024

%	Syd	Can	Mel	Hob	Ade	Per	Dar	Bri/GC

Note. ~Due to the particularly small samples ( $n < 50$ ) recruited in Darwin in 2010-2013 and 2022-2023, data from these years are not presented in this table; furthermore, data from Darwin in 2006, 2008 and 2024 should be interpreted with caution due to small samples (2006:  $n=51$ ; 2008:  $n=55$ ; 2024:  $n=51$ ). Statistical significance for 2023 versus 2024 presented in table (except for Darwin); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

### Price, Perceived Purity and Perceived Availability

**Price:** In 2024, participants reported a median price of \$25 per tab (IQR=20-30;  $n=148$ ), unchanged from \$25 in 2023 (IQR=20-30;  $n=157$ ;  $p=0.066$ ), but higher than the median price reported between 2003 and 2020 (Figure 40).

**Perceived Purity:** Among those who commented in 2024 ( $n=249$ ), the perceived purity of LSD remained stable, relative to 2023 ( $p=0.239$ ). Specifically, 55% reported purity as 'high' (58% in 2023), and one quarter (27%) reported it as 'medium', unchanged from 27% in 2023 (Figure 41).

**Perceived Availability:** Among those able to comment in 2024 ( $n=256$ ), the perceived availability of LSD remained stable, relative to 2023 ( $p=0.742$ ). Almost two fifths (38%) perceived LSD to be 'easy' to obtain (35% in 2023). In contrast, 30% reported LSD to be 'difficult' to obtain (34% in 2023) (Figure 42).

Figure 40: Median price of LSD per tab, nationally, 2003-2024

Note. Among those who commented. The error bars represent the IQR. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## DMT

### Patterns of Consumption

**Recent Use (past 6 months):** The per cent reporting recent DMT use has fluctuated over the reporting period, however, has consistently remained below 20%. In 2024, 10% of participants reported recent use, stable relative to 2023 (13%;  $p=0.143$ ) (Figure 43). Use remained stable in all capital city samples except in the Perth sample, where a significant decrease was observed (11; 26% in 2023;  $p=0.013$ ) (Table 16).

**Frequency of Use:** Use has remained infrequent and stable over the monitoring period, with a median of two days of use (IQR=1-3;  $n=75$ ) reported by participants in 2024 (1 day in 2023; IQR=1-3;  $n=89$ ;  $p=0.065$ ) (Figure 43).

**Routes of Administration:** Among participants who had recently consumed DMT and commented ( $n=75$ ), the most common route of administration in 2024 was smoking (92%; 98% in 2023;  $p=0.143$ ), followed by swallowing (8%;  $n\leq 5$  in 2023). Few participants ( $n\leq 5$ ) reported snorting; therefore, these numbers are suppressed.

**Quantity:** Among those who reported recent use and responded ( $n=23$ ), the median amount used in a 'typical' session was 10 mgs (IQR=2-23; 10 mgs in 2023; IQR=1-48;  $p=0.950$ ). Of those who reported recent use and responded ( $n=23$ ), the median maximum amount used in a session was 10 mgs (IQR=3-43; 10 mgs in 2023; IQR=1-50;  $p=0.740$ ).

Figure 43: Past six month use and frequency of use of DMT, nationally, 2010-2024

Note. Data collection for DMT commenced in 2010. Median days computed among those who reported recent use (maximum 180 days). Median days rounded to the nearest whole number. Secondary Y axis reduced to 10 days to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p<0.050$ ; \*\* $p<0.010$ ; \*\*\* $p<0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Please refer to Table 1 for a guide to table/figure notes.

# 9

## New Psychoactive Substances

---

New psychoactive substances (NPS) are often defined as substances which do not fall under international drug control, but which may pose a public health threat. However, there is no universally accepted definition, and in practicality the term has come to include drugs which have previously not been well-established in recreational drug markets. Participants were asked about their recent (past six month) use of various NPS.

---

## New Psychoactive Substances (NPS)

In previous (2010-2020) EDRS reports, DMT and *paramethoxyamphetamine* (PMA) were categorised as NPS. However, the classification of these substances as NPS is not universally accepted, and in 2021 onwards, the decision was made to exclude them from this category. This means that the figures presented below for recent use of tryptamine, phenethylamine and any NPS will not align with those in our 2010-2020 reports.

Further, some organisations (e.g., the United Nations Office on Drugs and Crime) include plant-based substances in their definition of NPS, whilst other organisations exclude them. To allow comparability with both methods, we present figures for 'any' NPS use, both including and excluding plant-based NPS.

## Patterns of Consumption

### Recent Use (past 6 months)

Any NPS use, including plant-based NPS, has fluctuated over time, peaking at 44% in 2013 and declining to 11% in 2022. In 2024, 16% reported recent use, a significant increase from 12% in 2023 ( $p=0.022$ ) (Table 17).

Fourteen per cent of the sample reported recent use of any NPS, excluding plant-based NPS, stable relative to 2023 (11%;  $p=0.051$ ) (Table 18).

### Forms Used

Participants are asked about a range of NPS each year, updated to reflect key emerging substances of interest.

Historically, the 2C class and synthetic cannabinoids were the most highly endorsed NPS classes, both peaking in 2013 (20% and 16%, respectively), however use of these substances has since declined considerably. In 2024, 5% reported recent use of any 2C substance, stable relative to 2023 (5%;  $p=0.821$ ). Few participants ( $n\leq 5$ ) reported recent use of synthetic cannabinoids in 2024 ( $n\leq 5$  in 2023;  $p=0.117$ ). Recent use of mephedrone (the most commonly reported NPS in 2010) has decreased considerably over the past decade, with 1% reporting use in 2024 ( $n\leq 5$  in 2023;  $p=0.774$ ). In 2024, there was a significant increase in participants reporting use of 2-Fluorodeschloroketamine (2-FDCK) (1%; 0% in 2023;  $p=0.038$ ) and 'other drugs that mimic the effects of ecstasy' (2%; 0% in 2023;  $p<0.001$ ).

In 2024, dissociatives (4%; 2% in 2023;  $p=0.021$ ) and plant-based NPS (4%; 4% in 2023;  $p=0.149$ ) were the second most commonly used NPS classes, after phenethylamines (6% in 2024 and 2023, respectively) (Table 19).

<b>Other new and emerging psychoactive substances</b>	/	/	/	/	/	/	/	/	1	-	-	-	1	-	-

Note. Monitoring of NPS commenced in 2010. <sup>^</sup>In previous EDRS reports, PMA was included as a NPS under 'phenethylamines' and mescaline was included under both 'phenethylamines' and 'plant-based NPS'. In 2021, the decision was made to remove PMA from the NPS category altogether, while mescaline was removed from 'phenethylamines' and is now only coded under 'plant-based NPS'.

This means that the percentages reported for any phenethylamine NPS use in the 2021-2023 EDRS reports will not align with those presented in earlier (2010-2020) reports. ^^In previous (2010-2020) EDRS reports, DMT was included as a NPS under 'tryptamines', however, was removed from the NPS category in 2021 (refer to Chapter 8 for further information on DMT use among the sample). This means that the percentages reported for any tryptamine NPS use in the 2021-2023 EDRS reports will not align with those presented in earlier (2010-2020) reports. # The terms 'herbal highs' and 'legal highs' appear to be used interchangeably to mean drugs that have similar effects to illicit drugs like cocaine or cannabis but are not covered by current drug law scheduling or legislation. ~ In 2010 and between 2017-2019 three forms of 2C were asked about whereas between 2011-2016 four forms were asked about. From 2020 onwards, 'any' 2C use is captured. Statistical significance for 2023 versus 2024 presented in table; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

# 10

## Other Drugs

---

Participants were asked about their recent (past 6 month) use of various other drugs, including non-prescribed use of pharmaceutical drugs (i.e., use of a prescribed drug obtained from a prescription in someone else's name) and use of licit substances (e.g., alcohol, tobacco).

---

## Non-Prescribed Pharmaceutical Drugs

### Codeine

Before the 1 February 2018, people could access low-dose codeine products (<30mg, e.g., Nurofen Plus) over-the-counter (OTC), while high-dose codeine ( $\geq 30$ mg, e.g., Panadeine Forte) required a prescription from a doctor. On the 1 February 2018, legislation changed so that all codeine products, low- and high-dose, require a prescription from a doctor to access.

Up until 2017, participants were only asked about use of OTC codeine for non-pain purposes. Additional items on the use of prescription low-dose and prescription high-dose codeine were included in the 2018-2020 EDRS, however from 2021, participants were only asked about prescribed and non-prescribed codeine use, regardless of whether it was low- or high-dose.

**Recent Use (past 6 months):** In 2024, one tenth (11%) of the sample reported using non-prescribed codeine in the past six months, stable relative to 2023 (12%;  $p=0.749$ ) (Figure 45).

**Frequency of Use:** Participants who had recently used non-prescribed codeine and commented ( $n=83$ ) reported use on a median of three days (IQR=1-7) in the six months preceding interview, stable from 2023 (4 days; IQR=2-8;  $n=84$ ;  $p=0.248$ ).

### Pharmaceutical Opioids

**Recent Use (past 6 months):** The per cent of participants reporting any past six month use of non-prescribed pharmaceutical opioids, excluding codeine (e.g., methadone, buprenorphine, oxycodone, morphine, fentanyl), remained stable at 10% (9% in 2023;  $p=0.520$ ) (Figure 44).

**Frequency of Use:** Frequency of use remained low and stable in 2024 at a median of three days (IQR=2-11;  $n=72$ ) in the six months prior to interview (4 days in 2023; IQR=2-7;  $n=61$ ;  $p=0.633$ ).

**Forms used:** Among participants who had recently consumed non-prescribed pharmaceutical opioids and commented in 2024 ( $n=70$ ), the main form used in the six months preceding interview was oxycodone (77%). Fewer participants reported using tapentadol (20%), other opioids (16%), morphine (11%) and buprenorphine (9%).

### Benzodiazepines

From 2019-2023, participants were asked about non-prescribed alprazolam use and non-prescribed use of 'other' benzodiazepines (e.g., diazepam). In 2024, the two forms were combined, such that participants were asked about non-prescribed use of any benzodiazepines.

**Recent Use (past 6 months):** Recent use of non-prescribed benzodiazepines (e.g., Valium, Diazepam, Xanax, Kalma) has fluctuated over time, peaking at 41% in 2018 and 2019, and declining shortly thereafter. In 2024, 28% of the sample reported recent use of non-prescribed benzodiazepines, stable relative to 2023 (29%;  $p=0.684$ ) (Figure 44).

**Frequency of Use:** Participants who had recently used non-prescribed benzodiazepines (e.g., Valium, Diazepam, Xanax, Kalma) and commented ( $n=207$ ) reported use on a median of six days in the six months preceding interview (IQR=2-24; 7 days in 2023; IQR=3-30;  $n=204$ ;  $p=0.293$ ).

**Forms Used:** Among those who reported non-prescribed benzodiazepine use and responded in 2024 (n=182), the most commonly used brands were Valium (diazepam) (64%), followed by Xanax (alprazolam) (38%), the generic form of diazepam (17%), the generic form of clonazepam (13%) and the generic form of alprazolam (5%).

### Steroids

**Recent Use (past 6 months):** The per cent of the sample reporting recent steroid use has remained low and stable since monitoring commenced. In 2024, one per cent of the sample reported recent use, stable relative to 2023 (3% in 2023;  $p=0.149$ ) (Figure 45).

### Antipsychotics

**Recent Use (past 6 months):** Six per cent of the sample reported recent use of non-prescribed antipsychotics in 2024 (6% in 2023) (Figure 44).

**Frequency of Use:** Participants reported using non-prescribed antipsychotics on a median of four days (IQR=2-10; n=42) in the six months preceding interview (5 days in 2023; IQR=2-42; n=40;  $p=0.087$ ).

Figure 44: Non-prescribed use of pharmaceutical medicines in the past six months, nationally, 2007-2024

Note. Non-prescribed use is reported for prescription medicines. Monitoring of over-the-counter (OTC) codeine (low-dose codeine) commenced in 2010, however, in February 2018, the scheduling for codeine changed such that low-dose codeine formerly available OTC was required to be obtained via a prescription. To allow for comparability of data, the time series here represents non-prescribed low- and high dose codeine (2018-2024), with high-dose codeine excluded from pharmaceutical opioids from 2018. Between 2007 and 2023, participants were asked about 'alprazolam' and 'other benzodiazepines'. In 2024, 'alprazolam' and 'other benzodiazepines' were combined. Y axis reduced to 50% to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Other Illicit Drugs

### Non-Prescribed Hallucinogenic Mushrooms/Psilocybin

**Recent Use (past 6 months):** The per cent reporting recent non-prescribed hallucinogenic mushrooms/psilocybin use has fluctuated over the reporting period, however, an overall increase in use was observed between 2009 and 2020, and has remained relatively stable from 2020 onwards. In 2024, 45% of the sample had used non-prescribed hallucinogenic mushrooms/psilocybin in the six months preceding interview, stable relative to 2023 (42%;  $p=0.343$ ) (Figure 45).

**Frequency of Use:** Use of non-prescribed hallucinogenic mushrooms/psilocybin remained infrequent in 2024, with participants reporting a median of two days of use (IQR=1-4;  $n=333$ ), stable relative to 2023 (2 days; IQR=1-4;  $n=300$ ;  $p=0.164$ ).

### Kava

**Recent Use (past 6 months):** Seven per cent of the sample reported recent use of Kava, a significant increase from 4% in 2023 ( $p=0.011$ ) (Figure 45).

**Frequency of Use:** Among those who had recently consumed Kava and responded ( $n=50$ ), participants reported a median of two days of use (IQR=1-5), stable relative to 2023 (2 days; IQR=1-6;  $n=27$ ;  $p=0.941$ ).

### MDA

**Recent Use (past 6 months):** Five per cent of the sample reported using MDA in the six months preceding interview, stable from 2023 (4%;  $p=0.380$ ) (Figure 45).

**Frequency of Use:** Use remained infrequent and stable, with participants reporting a median of two days of use in the six months preceding interview (IQR=1-4;  $n=38$ ; 2 days in 2023; IQR=1-3;  $n=29$ ;  $p=0.198$ ).

### Substance with Unknown Contents

**Capsules:** Since peaking in 2017 (20%), a decline in recent use of capsules with 'unknown contents' has been observed. However, in 2024, recent use of capsules with 'unknown contents' significantly increased to 6% from 3% in 2023 ( $p=0.045$ ) (Figure 45).

**Other Unknown Substances:** From 2019, we asked participants about their use more broadly of substances with 'unknown contents'. In 2024, 20% of participants reported use of any substance with 'unknown contents', a significant increase from 13% in 2023 ( $p<0.001$ ). Of those who had recently consumed any 'unknown substance' and responded ( $n=146$ ), participants reported a median of one day of use in the six months preceding interview, stable relative to 2023 (1 day; IQR=1-3;  $n=90$ ;  $p=0.227$ ).

When broken down by substance form, 6% of the 2024 sample reported using pills with 'unknown contents', a significant increase from 3% in 2023 ( $p=0.021$ ). The per cent of participants who reported recently consuming powder with 'unknown contents' significantly increased from 7% in 2023 to 11% in 2024 ( $p=0.008$ ). Three per cent of the sample reported consuming crystal with 'unknown contents' (2% in 2023;  $p=0.115$ ).

**Quantity:** From 2020, we asked participants about the average amount of pills and capsules with 'unknown contents' used in the six months preceding interview. In 2024, among those who reported recent use of pills with 'unknown contents' and responded ( $n=45$ ), the median 'typical' amount used

in a session was one pill (IQR=1-2; 1 pill in 2023; IQR=1-2;  $p=0.075$ ). Of those who reported recent use of capsules with 'unknown contents' and responded ( $n=41$ ), the median 'typical' amount used in a session was 2 capsules (IQR=1-3; 2 capsules in 2023; IQR=1-3;  $p=0.953$ ).

### PMA

No participants reported recent use of PMA in 2024 or 2023 (Figure 45).

### PMMA

**Recent Use (past 6 months):** One per cent of the sample reported using PMMA in the six months preceding interview ( $n\leq 5$  in 2023;  $p=0.289$ ) (Figure 45).

**Frequency of Use:** Few participants ( $n\leq 5$ ) were able to report on the median frequency of use of PMMA, therefore, numbers have been suppressed.

### Heroin

**Recent Use (past 6 months):** Consistently small numbers have reported recent use of heroin (2% in 2024; 2% in 2023) over the reporting period (Figure 45).

**Frequency of Use:** Participants reported a median of four days of use (IQR=2-18;  $n=14$ ) in 2024, stable from 2023 (5 days; IQR=1-10;  $n=13$ ;  $p=0.941$ ).

### GHB/GBL/1,4-BD (Liquid E)

**Recent Use (past 6 months):** Twelve per cent of the sample reported recent use of GHB/GBL/1,4-BD in 2024, stable relative to 2023 (12%;  $p=0.933$ ) (Figure 45).

**Frequency of Use:** GHB/GBL/1,4-BD was used on a median of three days (IQR=1-12,  $n=85$ ) in 2024, stable relative to 2023 (3 days; IQR=1-15;  $n=82$ ;  $p=0.767$ ).

Figure 45: Past six month use of other illicit drugs, nationally, 2003-2024

Note. From 2019, participants were asked more broadly about 'substances contents unknown' (with further ascertainment by form) which may have impacted the estimate for 'capsules contents unknown'. Y axis reduced to 50% to improve visibility of trends. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Licit and Other Drugs

### Alcohol

**Recent Use (past 6 months):** The majority of the sample have reported recent alcohol use in each year since monitoring commenced (95% in 2024; 94% in 2023;  $p=0.741$ ) (Figure 46).

**Frequency of Use:** Participants who had recently used alcohol reported use on a median of 40 days (IQR=18-72;  $n=700$ ; 48 days in 2023; IQR=20-72;  $n=665$ ;  $p=0.671$ ). Almost three quarters (72%) of those who had recently used alcohol reported weekly or more frequent use, stable relative to 2023 (73%;  $p=0.627$ ). This percentage includes 3% who reported daily use (5% in 2023;  $p=0.223$ ).

### Tobacco

In 2024, for the first time, questions were included about illicit tobacco. This was defined as products sold illegally without the necessary taxes added to the price.

**Recent Use (past 6 months):** Almost three quarters (72%) of participants reported recent use of any tobacco in 2024, a significant increase relative to 2023 (64%;  $p<0.001$ ) (Figure 46). Thirty-seven per cent of participants reported recent use of illicit tobacco, with the most common products being branded tobacco packs (67%), followed by unbranded loose tobacco (38%) and branded loose tobacco (19%). Sixteen per cent reported using unbranded tobacco packs and other illicit tobacco products (8%).

**Frequency of Use:** Participants who had recently used any tobacco reported use on a median of 90 days (IQR=15-180;  $n=533$ ), a significant increase from 50 days in 2023 (IQR=10-180;  $n=449$ ;  $p=0.028$ ), with almost two fifths (39%) reporting daily use (35% in 2023;  $p=0.173$ ). Participants who had recently used illicit tobacco reported use on a median of 180 days (IQR=48-180;  $n=515$ ).

### E-cigarettes

From October 2021, Australians were required to have a prescription to legally access nicotine containing e-cigarette products for any purpose. In 2022, participants were asked for the first time about their use of both prescribed and non-prescribed e-cigarettes. Few participants reported recent use of prescribed e-cigarettes in 2022 (3%;  $n=21$ ), 2023 (3%;  $n=18$ ) and 2024 (1%;  $n=11$ ): this was stable between 2023 and 2024 ( $p=0.192$ ). Data below for 2022-2024 refers only to non-prescribed e-cigarette use; data for 2021 and earlier refers to any e-cigarette use.

**Recent Use (past 6 months):** Sixty-nine per cent of the sample reported non-prescribed e-cigarette use in the six months preceding interview, stable relative to 2023 (68%;  $p=0.777$ ) (Figure 46).

**Frequency of Use:** Median days of non-prescribed use in the past six months remained stable, relative to 2023 (120 days; IQR=24-180;  $n=509$ ; 120 days in 2023; IQR=30-180;  $n=481$ ;  $p=0.404$ ). Forty-four per cent of those who had recently used non-prescribed e-cigarettes reported daily use, stable relative to 2023 (46%;  $p=0.475$ ).

**Contents and Forms Used:** Among participants who had recently used non-prescribed e-cigarettes and responded in 2024 ( $n=488$ ), the majority (97%) reported using e-cigarettes containing nicotine. Among participants who had recently used e-cigarettes and responded in 2024 ( $n=508$ ), participants most commonly reported using disposable devices (95%), followed by re-fillable devices (17%).

One quarter (23%) of the sample reported vaping substances other than nicotine/vape juice. Among those who vaped substances other than nicotine/vape juice and commented (n=166), the most commonly vaped substances were cannabis (82%), followed by DMT (14%).

**Reason for Use:** Of those who reported non-prescribed e-cigarette use and responded (n=513), 30% reported that they did not use e-cigarettes as a smoking cessation tool in 2024, a significant increase relative to 2023 (36%;  $p=0.046$ ).

### Nicotine Pouches

**Recent Use (past 6 months):** Almost one fifth (19%) of the sample reported recent use of nicotine pouches (not asked in 2023) (Figure 46).

**Frequency of Use:** Participants who had recently used nicotine pouches reported use on a median of three days (IQR=1-20; n=144).

### Nitrous Oxide

**Recent Use (past 6 months):** The per cent of the sample reporting any recent use of nitrous oxide remained stable in 2024 (40%), relative to 2023 (40%;  $p=0.869$ ) (Figure 46).

**Frequency of Use:** Frequency of use also remained stable, with a median of three days (IQR=2-7; n=293) of use reported in 2024 (3 days in 2023; IQR=2-10; n=282;  $p=0.332$ ), equivalent to less than monthly use.

**Quantity:** Amongst those who reported recent use and responded, the median 'typical' amount used per session in 2024 was five bulbs (IQR=3-12; n=255; 7 bulbs in 2023; IQR=3-20; n=260;  $p=0.066$ ). Of those who reported recent use and responded (n=250), the median maximum amount used in a session was 10 bulbs (IQR=3-20; 10 bulbs in 2023; IQR=4-30; n=258;  $p=0.036$ ).

### Amyl Nitrite

Amyl nitrite is an inhalant which is currently listed as a Schedule 4 substance in Australia (i.e., available only with prescription) yet is often sold under-the-counter in sex shops. Following a review by the [Therapeutic Goods Administration](#), amyl nitrite was listed as Schedule 3 (i.e., for purchase over-the-counter) from 1 February 2020 when sold for human therapeutic purpose.

**Recent Use (past 6 months):** Use of amyl nitrite fluctuated between 2003 and 2019, although has remained relatively stable from 2019 onwards (Figure 46). In 2024, almost two fifths (39%) of the sample reported any recent use of amyl nitrite, remaining unchanged from 2023 (39%).

**Frequency of Use:** Frequency of amyl nitrite use remained stable (4 days; IQR=2-10; n=391) in 2024, relative to 2023 (4 days; IQR=2-12; n=277;  $p=0.535$ ).

Figure 46: Licit and other drugs used in the past six months, nationally, 2003-2024

Note. Regarding e-cigarettes, on 1 October 2021, legislation came into effect requiring people to obtain a prescription to legally import nicotine vaping products. Data from 2022 onwards refers to non-prescribed e-cigarettes only. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

# 11

## Drug-Related Harms and Other Behaviours

---

Participants were asked about various drug-related harms and other behaviours, including polysubstance use and bingeing, drug checking, hazardous alcohol use, non-fatal overdose following drug use, awareness of naloxone, injecting drug use, drug treatment, ecstasy and methamphetamine dependence, sexual health, mental health and psychological distress, health service access, experiences of stigma, driving under the influence of drugs, crime and modes of purchasing drugs. It should be noted that the following data refer to participants' understanding of these behaviours (e.g., may not necessarily represent medical diagnoses in the case of reporting on health conditions).

---

## Polysubstance Use

On the last occasion of ecstasy or related drug use, among those who answered (n=737), the most commonly used substances were alcohol (61%) and ecstasy (52%), followed by cannabis (35%), cocaine (30%), e-cigarettes (30%) and tobacco (30%).

The majority (82%; n=595) of the sample reported concurrent use of two or more drugs on the last occasion of ecstasy or related drug use (excluding tobacco and e-cigarettes). The most commonly used combinations of drug classes were depressants and stimulants (29%), followed by the use of cannabis, depressants and stimulants (14%). Seven per cent reported using cannabis and stimulants, and hallucinogens/dissociatives, depressants and stimulants, respectively (Figure 47). Sixteen per cent reported using stimulants alone.

**Figure 47: Use of depressants, stimulants, cannabis, hallucinogens and dissociatives on the last occasion of ecstasy or related drug use, nationally, 2024: Most common drug pattern profiles**

Note. % calculated out of total EDRS 2024 sample. The horizontal bars represent the per cent of participants who reported use of each substance on their last occasion of ecstasy or related drug use; the vertical columns represent the per cent of participants who used the combination of drug classes represented by the orange circles. Drug use pattern profiles reported by  $\leq 5$  participants or which did not include any of the four drug classes depicted are not shown in the figure but are counted in the denominator. Halluc./Dissoc = hallucinogens/dissociatives (LSD, hallucinogenic mushrooms, amyl nitrite, DMT, ketamine and/or nitrous oxide); depressants (alcohol, GHB/GBL, 1,4-BD, kava, opioids and/or benzodiazepines); stimulants (cocaine, MDA, ecstasy, methamphetamine and/or pharmaceutical stimulants). Use of benzodiazepines, opioids and stimulants could be prescribed or non-prescribed use. Note that participants may report use of multiple substances within a class. Secondary Y axis reduced to 34% to improve visibility of trends. Please refer to Table 1 for a guide to table/figure notes.

## Binge Drug Use

Participants were asked whether they had used any stimulant or related drug for 48 hours or more continuously without sleep (i.e., binged) in the six months preceding interview. The per cent of the sample who have reported bingeing has generally declined between 2003 and 2020, before stabilising

from 2020 onwards. In 2024, almost one third (30%) of the sample had binged on one or more drugs in the preceding six months, stable from 2023 (29%;  $p=0.688$ ) (Figure 48).

Figure 48: Past six month use of stimulants or related drugs for 48 hours or more continuously without sleep ('binge'), nationally, 2003-2024

Note. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Drug Checking

Drug checking is a common strategy used to test the purity and contents of illicit drugs. At the time interviewing commenced in 2024, the only government-sanctioned drug checking services that had operated in Australia were at the Groovin the Moo festival in Canberra, ACT (2018, 2019) and CanTEST, a fixed-site drug checking service in Canberra which has been operational since 17 July 2022. Queensland's first fixed-site drug checking service, CheQpoint, opened its doors in Brisbane shortly after EDRS recruitment commenced (April 20 2024), and a second service opened in the Gold Coast shortly after recruitment had finished (July 2024).

In 2024, one quarter (27%) of participants reported that they or someone else had tested the content and/or purity of their illicit drugs in Australia in the past year, a significant decrease from 38% in 2023 ( $p < 0.001$ ) (Figure 49). Of those who reported that they or someone else had tested their illicit drugs in the past year ( $n = 197$ ), 68% reported using colorimetric or reagent test kits, with fewer participants (20%) using testing strips (e.g., BTNX fentanyl strips or other immunoassay testing strips). Twenty-two per cent reported having their drugs tested via Fourier Transform Infrared Spectroscopy or other method of spectroscopy/chromatography.

Of those who reported that they or someone else had tested their illicit drugs in the past year ( $n = 197$ ), two fifths (43%) reported testing the drugs themselves, while another 43% reported having their drugs tested by a friend on the last occasion. Fewer participants (15%) reported having their drugs tested by a dealer on their last occasion of drug checking.

Figure 49: Lifetime and past year engagement in drug checking, nationally, 2019-2024

Note. Questions on drug checking commenced in 2019. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Alcohol Use Disorders Identification Test

The Alcohol Use Disorders Identification Test ([AUDIT](#)) was designed by the World Health Organization (WHO) as a brief screening scale to identify individuals with problematic alcohol use in the past 12 months.

The mean score on the AUDIT for the total sample (including participants who had not consumed alcohol in the past 12 months) was 13.4 (SD 7.4) in 2024, a significant increase from 12.7 (SD 7.4) in 2023 ( $p < 0.001$ ). AUDIT scores are divided into four 'zones' which indicate risk level. Specifically, scores between 0-7 indicate low risk drinking or abstinence; scores between 8-15 indicate alcohol use in excess of low-risk guidelines; scores between 16-19 indicate harmful or hazardous drinking; and scores 20 or higher indicate possible alcohol dependence.

Three quarters (76%) of participants obtained a score of eight or more (72% in 2023;  $p = 0.062$ ), indicative of hazardous use (Table 20).

Table 20: AUDIT total scores and per cent of participants scoring above recommended levels, nationally, 2010-2024

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
	N=667	N=558	N=573	N=667	N=790	N=753	N=778	N=769	N=790	N=791	N=800	N=766	N=694	N=704	N=702
<b>Mean AUDIT total score (SD)</b>	14.9 (6.9)	17.4 (6.6)	15.3 (7)	13.9 (6.8)	14.7 (6.2)	13.3 (6.2)	12.5 (6.7)	12.6 (6.3)	12.8 (6.8)	13.5 (7.1)	13.1 (6.4)	12.9 (7)	12.9 (7.4)	12.7 (7.4)	<b>13.4*** (7.4)</b>
<b>Score 8 or above (%)</b>	85	95	85	81	89	80	75	79	75	79	81	77	74	72	<b>76</b>
<b>AUDIT zones</b>															
<b>Score 0-7:</b>	15	5	15	19	11	20	25	21	25	21	19	23	26	28	<b>24</b>
<b>Score 8-15:</b>	39	38	38	46	44	46	44	49	43	45	51	43	39	39	<b>40</b>
<b>Score 16-19:</b>	20	20	20	15	25	18	15	14	15	17	15	17	14	15	<b>17</b>
<b>Score 20 or higher:</b>	26	37	37	20	20	17	16	15	17	18	16	16	20	19	<b>20</b>

Note. Monitoring of AUDIT commenced in 2010. Computed from the entire sample regardless of whether they had consumed alcohol in the past twelve months. Total AUDIT score range is 0-40, with higher scores indicating greater likelihood of hazardous and harmful drinking. Imputation used for missing scale scores. Statistical significance for 2023 versus 2024 presented in table; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Overdose Events

### Non-Fatal Overdose

Previously, participants had been asked about their experience in the past 12 months of i) stimulant overdose, and ii) depressant overdose.

From 2019, changes were made to this module, with participants asked about alcohol, stimulant and other drug overdose, prompted by the following definitions:

- **Alcohol overdose:** experience of symptoms (e.g., reduced level of consciousness, and collapsing) where professional assistance would have been helpful.
- **Stimulant overdose:** experience of symptoms (e.g., nausea, vomiting, chest pain, tremors, increased body temperature, increased heart rate, seizure, extreme paranoia, extreme anxiety, panic, extreme agitation, hallucinations, excited delirium) where professional assistance would have been helpful.
- **Other drug overdose (not including alcohol or stimulant drugs):** similar definition to above. Note that in 2019, participants were prompted specifically for opioid overdose but this was removed in 2020 as few participants endorsed this behaviour.

It is important to note that events reported on for each drug type may not be unique given high rates of polysubstance use among the sample.

For the purpose of comparison with previous years, we computed the per cent reporting any depressant overdose, comprising any endorsement of alcohol overdose, or other drug overdose where a depressant (e.g., opioid, GHB/GBL/1,4 BD, benzodiazepines) was listed.

### Non-Fatal Stimulant Overdose

Nineteen per cent of the sample reported experiencing a non-fatal stimulant overdose in the 12 months preceding interview in 2024, stable relative to 2023 (15%;  $p=0.113$ ) (Figure 50).

The most common stimulants reported during the most recent non-fatal stimulant overdose in the past 12 months comprised any form of ecstasy (58%; capsules: 29%; crystal: 21%; pills: 9% and powder: 7%), cocaine (29%), any form of methamphetamine (21%; crystal: 16%; powder:  $n \leq 5$ ) and pharmaceutical stimulants (15%). Of those who reported a non-fatal stimulant overdose in the past year and responded ( $n=135$ ), 79% reported that they had also consumed one or more additional drugs on the last occasion, most notably, any quantity of alcohol (56%;  $\geq 5$  standard drinks: 38%;  $\leq 5$  standard drinks: 19%), cannabis (29%), e-cigarettes (26%), tobacco (17%) and ketamine (9%). On the last occasion of experiencing a non-fatal stimulant overdose, 85% reported that they did not receive treatment. Among those who did not receive treatment, the most common reasons for not seeking treatment were 'deciding it wasn't serious enough' (49%), 'couldn't be bothered' (14%), 'fear of legal issues' (14%), 'fear of negative treatment/judgement' (13%) and 'embarrassed' (10%). Of those who reported receiving treatment ( $n=21$ ), most reported ambulance attendance (52%;  $n=11$ ) and hospital emergency department attendance (38%;  $n=8$ ).

### Non-Fatal Depressant Overdose

**Alcohol:** Almost one quarter (24%) of the sample reported a non-fatal alcohol overdose in the 12 months preceding interview, a significant increase from 19% in 2023 ( $p=0.025$ ). This was reported on

a median of two occasions (IQR=1-4) in 2024. Of those who had experienced an alcohol overdose in the past year in 2024 (n=175), the majority (82%) reported not receiving treatment on the last occasion. Among those who did not receive treatment, the most common reasons for not seeking treatment were 'deciding it wasn't serious enough' (42%), 'wasn't physically able to' (13%), 'couldn't be bothered' (11%), 'embarrassed' (6%) and 'fear of family being contacted' (5%). Of those who reported receiving treatment and commented (n=29), 55% reported hospital emergency department admission (n=16), followed by ambulance attendance (45%; n=13).

**Any depressant (including alcohol):** Twenty-eight per cent of the sample reported that they had experienced a non-fatal depressant overdose (including alcohol) in the past 12 months, also a significant increase from 22% in 2023 ( $p=0.014$ ) (Figure 50).

Of those who had experienced any depressant overdose in the past 12 months (n=206), the majority reported alcohol as the most common depressant drug (85%), with fewer participants reporting GHB/GBL/1,4-BD (9%), benzodiazepines (including alprazolam) (8%) and opioids (including heroin and pharmaceutical opioids) (4%).

Figure 50: Past 12 month non-fatal stimulant and depressant overdose, nationally, 2007-2024

Note. Questions on past year stimulant and depressant overdose commenced in 2007. In 2019, items about overdose were revised, and changes relative to 2018 and earlier may be a function of greater nuance in capturing depressant events. Statistical significance for 2023 versus 2024 presented in figure; \* $p<0.050$ ; \*\* $p<0.010$ ; \*\*\* $p<0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Awareness of Naloxone

In 2024, nearly two thirds (63%) of the sample reported that they had ever heard of naloxone, a significant increase from 57% in 2023 ( $p=0.015$ ). Among those who had ever heard of naloxone and responded (n=451), 91% were able to correctly identify the purpose of naloxone, stable from 89% in 2023 ( $p=0.477$ ). Among participants who had ever heard of naloxone and responded (n=461), 14% reported obtaining naloxone in their lifetime (9% of entire sample) (13% in 2023;  $p=0.843$ ) and 10%

reported obtaining naloxone in the twelve months prior to interview (6% of entire sample) (9% in 2023;  $p=0.640$ ).

## Injecting Drug Use

For the past several years, approximately one in ten participants have reported ever injecting drugs (10% in 2024; 13% in 2023;  $p=0.128$ ). The per cent who reported injecting drugs in the past month has remained low and stable, with 1% reporting past month injection in 2024 (2% in 2023;  $p=0.119$ ) (Figure 51).

Figure 51: Lifetime and past month drug injection, nationally, 2003-2024

Note. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Drug Treatment

A nominal per cent reported currently receiving drug treatment in 2024 (6%), stable compared with 2023 (6%;  $p=0.577$ ). Of those who had reported being in treatment in 2024 ( $n=48$ ), the majority (69%) reported drug counselling as their main form of treatment (58% in 2023).

## Ecstasy and Methamphetamine Dependence

From 2017, participants were asked questions from the Severity of Dependence Scale (SDS) adapted to investigate ecstasy and methamphetamine dependence. The SDS is a five-item questionnaire designed to measure the degree of dependence on a variety of drugs. The SDS focuses on the psychological aspects of dependence, including impaired control of drug use, and preoccupation with, and anxiety about use. A total score was created by summing responses to each of the five questions. Possible scores range from 0 to 15.

To assess ecstasy dependence in the past six months, [a cut-off score of three](#) or more was used, as this has been found to be a good balance between sensitivity and specificity for identifying problematic dependent ecstasy use. Among those who reported recent ecstasy use and commented ( $n=674$ ), 16% recorded a score of three and above, stable relative to 2023 (14%;  $p=0.175$ ). The median ecstasy SDS score was zero (IQR=0-2). In 2024, 53% of participants obtained a score of zero on the ecstasy SDS, indicating that the majority of respondents reported no symptoms of dependence in relation to ecstasy use, although this was a significant decrease relative to 2023 (63%;  $p<0.001$ ) (Table 21).

To assess methamphetamine dependence in the past six months, the [cut-off of four and above](#), which is a more conservative estimate, has been used previously in the literature as a validated cut-off for methamphetamine dependence. Of the 179 participants who reported recent methamphetamine use and completed this section, two fifths (41%) scored four or above, stable relative to 40% in 2023 ( $p=0.837$ ). The median methamphetamine SDS score was two (IQR=0-5). In 2024, two fifths (40%) of participants obtained a score of zero on the methamphetamine SDS (41% in 2023;  $p=0.761$ ), indicative of no symptoms of dependence in relation to methamphetamine use (Table 21).

**Table 21: Total ecstasy and methamphetamine SDS scores, and per cent of participants scoring above cut-off scores indicative of dependence, among those who reported past six month use, nationally, 2017-2024**

Note. Severity of Dependence scores calculated out of those who used ecstasy/methamphetamine recently (past 6 months). A cut-off score of ≥3 and ≥4 is used to indicate screening positive for potential ecstasy and methamphetamine dependence, respectively. Imputed values used for missing scale scores. Statistical significance for 2023 versus 2024 presented in table; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Sexual Health Behaviours

In 2024, almost four fifths (78%) of the sample reported some form of sexual activity in the past four weeks (79% in 2023;  $p=0.435$ ). Given the sensitive nature of these questions, participants were given the option of self-completing this section of the interview (if the interview was undertaken face-to-face).

Of those who had engaged in sexual activity in the past four weeks and responded ( $n=558$ ), 81% ( $n=451$ ) reported using alcohol and/or other drugs prior to or while engaging in sexual activity, stable relative to 2023 (81%;  $p=0.812$ ). Of those who had engaged in sexual activity in the past four weeks and responded ( $n=556$ ), 11% ( $n=59$ ) reported that their use of alcohol and/or other drugs had impaired their ability to negotiate their wishes during sex (10% in 2023;  $p=0.767$ ), while 36% ( $n=198$ ) reported that they had used alcohol and/or other drugs to enhance sexual activity or pleasure with another person (not asked prior to 2024). Two per cent ( $n=13$ ) had engaged in sexual activity in exchange for money, drugs, or other goods or services (not asked prior to 2024) (Table 22).

Of those who commented ( $n=727$ ), one third (35%) reported having a sexual health check-up in the six months prior to interview (33% in 2023;  $p=0.425$ ), whilst 72% had done so in their lifetime (75% in 2023;  $p=0.186$ ). Of the total sample who responded ( $n=727$ ), 5% reported that they had received a positive diagnosis for a sexually transmitted infection (STI) in the past six months in 2024, stable relative to 2023 (6%;  $p=0.194$ ) and 22% had received a positive diagnosis in their lifetime (26% in 2023;  $p=0.065$ ). The most common STI reported amongst participants who commented ( $n=33$ ) was chlamydia (61%), followed by gonorrhoea (18%).

Of those who commented ( $n=717$ ), one quarter (26%) of the sample reported having a test for human immunodeficiency virus (HIV) in the six months prior to interview (26% in 2023;  $p=0.900$ ), whilst 56%

had done so in their lifetime, a significant decrease from 65% in 2023 ( $p<0.001$ ). In 2024, few ( $n\leq 5$ ) participants had been diagnosed with HIV in the past six months ( $n\leq 5$  in 2023) or within their lifetime ( $n\leq 5$  in 2023).

Note. <sup>#</sup> Due to the sensitive nature of these items, there is missing data for some participants who chose not to respond. Statistical significance for 2023 versus 2024 presented in table; \* $p<0.050$ ; \*\* $p<0.010$ ; \*\*\* $p<0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Mental Health and Psychological Distress (K10)

### Mental Health

Almost three fifths (58%) of the sample self-reported that they had experienced a mental health problem in the preceding six months (other than drug dependence), stable relative to 2023 (58%;  $p=0.958$ ) (Figure 52). Of those who reported a mental health problem and commented ( $n=418$ ), the most common mental health problem reported was anxiety (68%; 67% in 2023;  $p=0.826$ ), followed by depression (62%; 62% in 2023) and attention-deficit hyperactivity disorder (ADHD) (25%; 27% in 2023;  $p=0.414$ ). Of those who reported experiencing a mental health problem ( $n=428$ ), 62% (36% of the

total sample) reported seeing a mental health professional during the past six months (57% in 2023;  $p=0.184$ ). Of those who attended a mental health professional in 2024 ( $n=266$ ), 67% reported being prescribed medication for their mental health problem (60% in 2023;  $p=0.099$ ).

**Figure 52: Self-reported mental health problems and treatment seeking in the past six months, nationally, 2008-2024**

Note. Questions about treatment seeking commenced in 2008. The combination of the per cent who report treatment seeking and no treatment is the per cent who reported experiencing a mental health problem in the past six months. Statistical significance for 2023 versus 2024 presented in figure; \* $p<0.050$ ; \*\* $p<0.010$ ; \*\*\* $p<0.001$ . Please refer to Table 1 for a guide to table/figure notes.

### Psychological Distress (K10)

The [Kessler Psychological Distress Scale 10 \(K10\)](#) was administered to obtain a measure of psychological distress in the past four weeks. It is a 10-item standardised measure that has been found to have good psychometric properties and to identify clinical levels of psychological distress as measured by the Diagnostic and Statistical Manual of Mental Disorders, and the Structured Clinical Interview for DSM disorders.

The minimum score is 10 (indicating no psychological distress) and the maximum is 50 (indicating very high psychological distress). Scores can be coded into four categories to describe degrees of distress: scores from 10–15 are considered to indicate 'low' psychological distress; scores between 16–21 indicate 'moderate' psychological distress; scores between 22–29 indicate 'high' psychological distress; and scores between 30–50 indicate 'very high' psychological distress. Among the general population, scores of 30 or more have been demonstrated to indicate a high likelihood of having a mental health problem, and possibly requiring clinical assistance.

Among those who responded in 2024 ( $n=731$ ), the per cent of participants scoring in each of the four K10 categories remained stable between 2023 and 2024 ( $p=0.171$ ). In 2024, one fifth (22%) of the EDRS sample had a score of 30 or more (18% in 2023) (Figure 53).

The [National Health Survey 2022-2023](#) provides Australian population data for adult ( $\geq 18$  years) K10 scores. EDRS participants in 2024 reported greater levels of 'moderate', 'high' and 'very high' distress compared to the general population (Figure 53).

**Figure 53: K10 psychological distress scores, nationally, 2006-2024, and among the general population, 2022-2023**

Note. Questions on psychological distress commenced in 2006. Data from the National Health Survey are a national estimate from 2022-23 for adults 18 or older. Imputation used for missing scale scores (EDRS only). Statistical significance for 2023 versus 2024 presented in table; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Health Service Access

Almost one third (30%) of participants reported accessing any health service for alcohol and/or drug support (AOD) in the six months preceding interview, stable relative to 2023 (26%;  $p = 0.095$ ). The most common services reported by participants in 2024 included a general practitioner (GP) (10%; 9% in 2023;  $p = 0.377$ ), followed by a drug and alcohol counsellor (8%; 8% in 2023;  $p = 0.918$ ) and a psychologist (8%; 7% in 2023;  $p = 0.622$ ) (Table 23).

Ninety-two per cent of participants reported accessing any health service for any reason in the six months preceding interview in 2024, a significant increase from 87% in 2023 ( $p = 0.006$ ). The most common service accessed by participants in 2024 was a GP (77%; 70% in 2023;  $p = 0.003$ ), followed by a pharmacy (52%; not asked in 2023), a dentist (33%; 37% in 2023;  $p = 0.208$ ) and a psychologist (28%; 29% in 2023;  $p = 0.599$ ) (Table 23).

One fifth (22%) of participants reported attending the emergency department in the six months preceding interview (for any reason) (21% in 2023;  $p = 0.845$ ), with the most common reasons being injury (9%), poisoning (4%) and other mental or behavioural conditions (2%). Furthermore, 8%

reported being attended to by an ambulance in the six months prior to interview (for any reason) (7% in 2023;  $p=0.915$ ), most commonly because of poisoning (4%), injury (1%) and AOD mental or behavioural conditions (1%).

**Table 23: Types of health services accessed for alcohol and other drug reasons and for any reason in the past six months, nationally, 2022-2024**

Figure 54: Health service access for alcohol and other drug reasons, and for any reason, in the past six months, nationally, 2004-2024

Note. Questions on health service access commenced in 2004. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Stigma

Questions regarding stigma were derived from the [Stigma Indicators Monitoring Project](#), with stigma defined as people being treated negatively or differently because of their illicit drug use. These questions have been asked, in part, since 2022.

In 2024, one quarter (28%) of the sample reported experiencing stigma because of their illicit drug use in any health/non-health care setting in the six months preceding interview (25% in 2023;  $p=0.199$ ).

Specifically, 6% of the sample reported experiencing stigma within specialist alcohol and other drug (AOD) services in the six months preceding interview (18% of those who had attended a specialist AOD service), a significant increase from 3% in 2023 ( $p<0.007$ ; noting that this could be driven by more participants attending AOD services). A larger percentage, however, reported experiencing stigma within general health care services in the six months preceding interview (15%; 17% of those who had attended general health care services), stable relative to 2023 (14% in 2023;  $p=0.817$ ). Nineteen per cent of participants reported experiencing stigma in non-health care settings (15% in 2023;  $p=0.131$ ), most commonly from police (10%; 10% in 2023) (Table 24).

Notably, 44% of participants reported engaging in some form of avoidance behaviour to avoid being treated negatively or differently by AOD specialist or general healthcare services, a significant increase from 39% in 2023 ( $p=0.033$ ). This most commonly involved not telling health workers about their drug use (37%), followed by delaying accessing health care (15%) and not attending follow-up appointments (13%).

**Table 24: Self-reported experiences of stigma due to illicit drug use in the past six months, nationally, 2022-2024**

	2022	2023	2024

Note. N is the number who responded (denominator). <sup>^</sup>Includes specialist AOD service, general health care service and non-health care services. Statistical significance for 2023 versus 2024 presented in table (significance testing not undertaken for individual services); \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Driving

In 2024, 82% of the sample had driven a car, motorcycle or other vehicle in the last six months. Of those who had driven in the past six months and commented ( $n=574$ ), 29% reported driving while over the perceived legal limit of alcohol in the past six months (33% in 2023;  $p=0.160$ ). Among those who had driven and commented ( $n=598$ ), 50% reported driving within three hours of consuming an illicit or non-prescribed drug in the last six months, a significant increase relative to 2023 (44%;  $p=0.037$ ), but similar to the per cent reported in 2022 (51%) and lower than reported when monitoring first commenced (Figure 55).

Of those who had driven within three hours of consuming an illicit or non-prescribed drug in the last six months and responded ( $n=301$ ), participants most commonly reported using cannabis (60%) prior to driving, followed by cocaine (20%), pharmaceutical stimulants (15%) and methamphetamine crystal

(14%). Additionally, 9% reported using ecstasy capsules three hours prior to driving in the six months preceding interview.

Of those who had recently driven and commented (n=601), 13% reported that they had been tested for drug driving by the police roadside drug testing service (14% in 2023;  $p=0.669$ ), and 35% reported that they had been breath tested for alcohol by the police roadside testing service in the six months prior to interview (39% in 2023;  $p=0.155$ ) (Figure 55).

Figure 55: Self-reported testing, and driving over the (perceived) legal limit for alcohol or three hours following illicit drug use, among those who had driven in the past six months, nationally, 2007-2024

Note. Questions about driving behaviour commenced in 2007. Computed of those who had driven a vehicle in the past six months. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

## Experience of Crime and Engagement with the Criminal Justice System

Past month self-reported criminal activity has fluctuated over time, with 41% reporting 'any' crime in the past month in 2024, a significant increase relative to 2023 (35%;  $p=0.042$ ). Drug dealing (24%) and property crime (23%) remained the two main forms of criminal activity in 2024, with a significant increase observed for those reporting property crime (18% in 2023;  $p=0.014$ ) (Figure 56). Ten per cent reported being the victim of a crime involving violence (e.g., assault) in 2024, which remained stable compared to 2023 (8%;  $p=0.193$ ) (Figure 57).

Six per cent of the sample reported a lifetime history of imprisonment in 2024, stable relative to 2023 (5%;  $p=0.243$ ) (Figure 58).

Seven per cent of respondents in the 2024 sample reported having been arrested in the 12 months preceding interview, stable from 2023 (7%) (Figure 58). Of those who had been arrested in the prior 12 months and commented ( $n=51$ ), the main reasons for arrest in 2024 were use/possession of drugs (25%) followed by violent crime (20%) and public order (drunk and disorderly) (18%).

Fourteen per cent of participants (16% in 2023;  $p=0.341$ ) reported a drug-related encounter with police in the year preceding interview which did not result in charge or arrest (Figure 58). This predominantly comprised being stopped and searched (48%; 60% in 2023;  $p=0.081$ ), followed by being stopped and questioned (36%; 54% in 2023;  $p=0.012$ ). An additional 18% reported being stopped and issued a caution (20% in 2023;  $p=0.742$ ), 15% reported being stopped and issued with a fine/infringement notice (12% in 2023;  $p=0.434$ ) and 11% reported being stopped and issued with a drug diversion (9% in 2023;  $p=0.814$ ).

Figure 56: Self-reported criminal activity in the past month, nationally, 2003-2024

Note. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 57: Victim of crime involving violence in the past month, nationally, 2019-2024

Note. Questions regarding being the victim of a crime involving violence commenced in 2019. Statistical significance for 2023 versus 2024 presented in figure; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.

Figure 58: Lifetime incarceration, and past 12 month arrest and drug-related encounters with police that did not result in arrest, nationally, 2003-2024

## Modes of Purchasing Illicit or Non-Prescribed Drugs

In interviewing and reporting, 'online sources' were defined as either surface or darknet marketplaces.

### Purchasing Approaches

In 2024, the most popular means of arranging the purchase of illicit or non-prescribed drugs in the 12 months preceding interview was face-to-face (74%; 72% in 2023;  $p=0.437$ ) (Table 25), followed closely by social networking or messaging applications (e.g., Facebook, Wickr, WhatsApp, Snapchat, Grindr, Tinder) (70%; 71% in 2023;  $p=0.641$ ). It is important to re-iterate that this refers to people *arranging the purchase* of illicit or non-prescribed drugs. This captures participants who messaged friends or known dealers on Facebook Messenger or WhatsApp, for example, to organise the purchase of illicit or non-prescribed drugs, which may have then been picked up in person. In 2024, the most common social networking or messaging apps used to arrange the purchase of illicit drugs was Snapchat (55%), followed by Telegram (32%) and Signal (30%), and these were mostly obtained from a friend/relative/partner/colleague (65%), followed by a known dealer/vendor (64%). Among those who used social networking or messaging apps to arrange the purchase of drugs in 2024 and responded ( $n=506$ ), 47% reported that the person that they had obtained drugs from advertised the sale of illicit drug/s via these platforms.

Two fifths (42%) reported arranging the purchase of illicit or non-prescribed drugs via text messaging, stable from 42% in 2023 ( $p=0.958$ ), followed by phone call (27%; 27% in 2023).

### Buying and Selling Drugs Online

Seven per cent reported obtaining drugs via the surface web or darknet market in the past year, most commonly LSD (3%), followed by equal percentages of ketamine, cocaine and ecstasy crystal (2%, respectively). Almost two fifths (39%) reported that they had ever obtained illicit drugs through someone who had purchased them on the surface web or darknet market, with 26% doing so in the 12 months prior to interview (31% in 2023;  $p=0.086$ ).

In 2024, 3% of participants reporting selling illicit drugs on the surface web or darknet market in the 12 months preceding interview (3% in 2023;  $p=0.880$ ).

### Source and Means of Obtaining Drugs

The majority of participants in 2024 reported obtaining illicit drugs from a friend/relative/partner/colleague (84%), a significant increase from 79% in 2023 ( $p=0.032$ ). This was followed by a known dealer/vendor (64%; 65% in 2023;  $p=0.538$ ) and an unknown dealer/vendor (33%; 30% in 2023;  $p=0.192$ ) (Table 25).

When asked about how they had received illicit drugs on any occasion in the last 12 months, the majority of participants reported face-to-face (96%), stable relative to 2023 (96%;  $p=0.887$ ). Almost one quarter (23%) of participants reported a collection point as a means of receiving illicit drugs in the 12 months preceding interview, a significant increase relative to 2023 (17%;  $p=0.005$ ) (collection point defined as a predetermined location where a drug will be left for later collection), followed by post (10%; 10% in 2023;  $p=0.929$ ) (Table 25).

Table 25: Means of purchasing and obtaining illicit drugs in the past 12 months, nationally, 2019-2024

	2019	2020	2021	2022	2023	2024
	N=792	N=799	N=774	N=700	N=708	N=740

Known dealer/vendor	70	67	66	68	65	<b>64</b>
Unknown dealer/vendor	38	37	30	37	30	<b>33</b>

Note. <sup>^</sup> participants could endorse multiple responses. <sup>#</sup>This refers to people *arranging the purchase* of illicit or non-prescribed drugs. This captures participants who messaged friends or known dealers on Facebook Messenger or WhatsApp, for example, to organise the purchase of illicit or non-prescribed drugs, which may have then been picked up in person. <sup>~</sup> The face-to-face response option in 2021 was combined by those responding, 'I went and picked up the drugs', 'The drugs were dropped off to my house by someone' and/or 'Was opportunistic – I arranged and collected at the same time (e.g., at an event/club)'. Statistical significance for 2023 versus 2024 presented in table; \* $p < 0.050$ ; \*\* $p < 0.010$ ; \*\*\* $p < 0.001$ . Please refer to Table 1 for a guide to table/figure notes.
